EC57-K01

Bus type open and closed loop stepper driver

User ManualV1.0.0

Shenzhen Gerui IoT Technology Co., Ltd.

Table of contents

1. Product Introduction

1.1Product Overview

EC57-K01Bus type open and closed loop integrated stepper driver adoptsEtherCATBus communication interface,EtherCATSlave technology, vector

The control technology, built-in micro-segmentation technology, adaptive filtering technology, and closed-loop control technology are integrated to achieve real-time control and real-time operation of the stepping system.

Real-time data transmission optimizes the performance of the stepper motor: low and medium speeds have excellent stability and ultra-low noise; high-speed torque is greatly improved, expanding

It expands the speed application range of stepper motors; smooth and precise pure sinusoidal current vector control technology effectively reduces motor heating.

EC57-K01The bus-type open-closed loop integrated stepper driver has perfectly supported many master stations such as Beckhoff, Omron, Positive Motion, Inovance, and Xinjie.

control system, and has been widely used in textiles, robots, lithium battery equipment,3CElectronics and other industries.

1.2Product Features

● New Generation32BitARMTechnology, high cost performance, good stability, excellent noise and vibration performance

● useEtherCATSlave technology, supportCIA301as well asCIA402Sub-protocol, supportCSP,PV,PP,HMmodel

● Users canethercatSet the current, subdivision and lock current by bus or serial communication

● Built-in single-axis controller function: users can set synchronous position mode, speed mode, position mode, and homing mode through the bus

● 54 opto-isolated programmable input interfaces to receive external control signals and realize driver limit, origin, emergency stop and other functions

● Built-in micro-segmentation

● Built-in motor parameter setting

● Any current reduction ratio can be set when stationary

● Convenient current setting

● With overvoltage, undervoltage and other protection functions

● Good stability, excellent noise and vibration performance

● Support position control, speed control and other modes

● Pure sinusoidal current vector control effectively reduces motor heating

● 3Opto-isolated programmable output interface, output driver status and control signals

● With arbitrary subdivision adjustment, you can change the subdivision at will

● Closed loop can set out-of-tolerance alarm value

● Excellent stability at low frequencies and small subdivisions

● Voltage Range:DC 20-50V

1.3Networking Solution
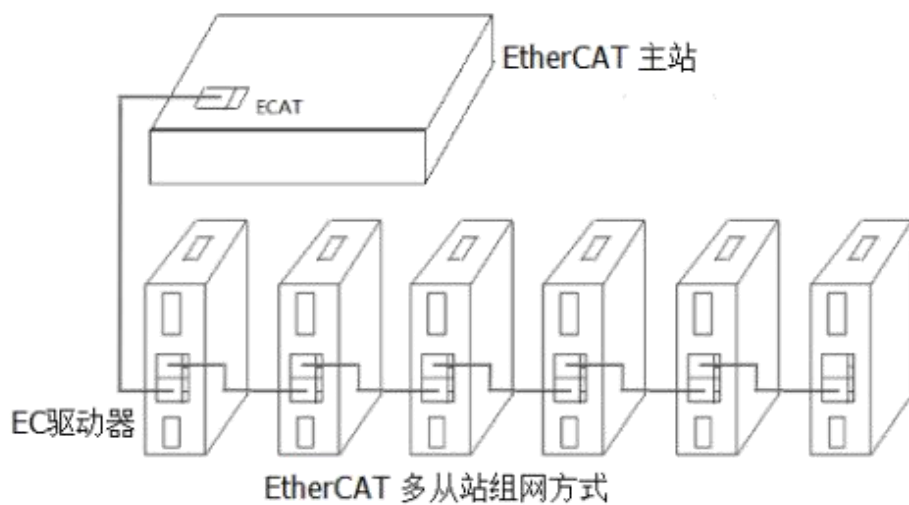

picture1Bus type stepping networking solution

2. Installation dimensions and interface definition

2.1Mechanical installation drawing

Front installation diagram   Side installation diagram
picture2.1   Installation Dimensions (Unit:mm)

2.2Installation Notes

- 3 -

1) When installing the driver, please use side installation for better heat dissipation. When designing the installation dimensions, consider the terminal size and wiring.

2) In order to ensure good heat dissipation conditions, a larger installation interval must be reserved as much as possible during actual installation. If necessary, install the

Install a fan to form strong air convection on the bottom of the driver to assist in heat dissipation and ensure that the driver operates within a reliable operating temperature range.

2.3Electrical Specifications

illustrate	EC57-K01Bus type open and closed loop stepper driver			
	Minimum	Typical Value	Maximum	unit
Output Current	0	-	6000	mA
Input power voltage	20	36	50	VDC
Control signal input current	7	10	16	mA
Insulation resistance	50	-	-	MΩ

2.4Use environment and parameters

Cooling method		Natural cooling, fan cooling
Usage Environment	occasion	Do not place it near other heating equipment. Avoid dust, oil mist, corrosive gas, high humidity and strong vibration. Do not place it near flammable gas and conductive dust.
	temperature	- 25℃~55℃
	humidity	40~90%RH
	vibration	10~55Hz/0.15mm
Storage temperature		- 25℃~65℃

3. Driver interface and wiring description

3.1 Driver Interface Introduction

surface3.1Driver interface

name			Function	illustrate
Dip switchSW1-4			Set the open and closed loop mode, current, Motor rotation direction	SW1: Driver open/closed loop selection
				SW2-3: Current selection
				SW4: Direction switch
ALM			Alarm indicator light	Overcurrent, overvoltage, phase loss, EEPROMFlashing when programming error occurs
PWR			Power indicator	The light is on when the power is normal
ECAT IN/OUT			EtherCATCommunication port	ECAT IN:Enter ECAT OUT:out
IN/OUT	Xcom		Single-ended input common / Correct connection is effective	Connect to anode
	Ycom		Single-ended output common port / Compatible with common cathode and common anode	Compatible with both common cathode and common anode connection
	X0		Single-ended input	Low-speed digital signal input interface
	X1			
	X2

3.2Dip switch

surface3.2DIP switch function description

name	Function	illustrate
Dip switchSW1-SW4	Set the open-loop and closed-loop modes. Flow, motor rotation direction	SW1: Driver open/closed loop selection
		SW2-SW3: Current selection
		SW4: Direction switch

3.2.1Open and closed loop mode settings

Open and closed loop modes can be switched by dialingSW1Select as shown in the following table.

surface3.3Open and closed loop mode settings

SW1	Working Mode
off	Open Loop
on	closed loop

3.2.2Current setting

In open and closed loop mode, you can dialSW2-SW3Set the current size, total4Current can be selected, compatible42-86Electric

If the user needs to adjust the current, the upper computer software orECATMaster station settings, but need toSW2-SW3Dial tooffstate

Can be adjusted.

surface3.4Current setting

SW2	SW3	Open Loop		closed loop	
		Peak	RMS	Imin	Imax
off	off	1.0	0.7	0.2	0.7
on	off	2.1	1.5	0.3	1.2
off	on	4.2	3.0	0.5	2.5
on	on	5.6	4.0	1.0	4.8

3.2.3Direction switch settings

Users can dialSW4Select the initial motor rotation direction as shown in the following table.

surface3.5Direction switch settings

SW4	Initial rotation direction
off	Positive direction
on	Reverse direction

3.3Indicator Lights

EC57-K01The indicator light of the bus-type open-closed loop integrated stepper driver is a retractable patchled, there is a small cutout on the drive to observe

The basic definition of indicator light status is as follows:3.6shown.

surface3.6Indicator lamp definition

name	describe	Function	illustrate
ALM	redled	Power supply, save parameter function indication, restore factory settings	When the power is on normally, the green light is always on and the red light is off. Save parameters, restore factory settings, and switch to the DIP state
PWR	greenled	Setting function indication, dial status switching indication, Alarm indicator light	When an abnormality occurs in the equipment, the red light flashes to warn. See Chapter 7 for the rules of shimmering;

3.4 EC57-K01Communication interface

EC57-K01The communication interface of the bus-type open-closed loop integrated stepper driver adopts the standard one-pieceRJ45Socket, as shown below3.1shown.

The left port is the input port, which is connected to the output port of the previous driver; the right port is the output port, which is connected to the input port of the next driver.
picture3.1One-pieceRJ45Interface Diagram

3.5Input signal interface

3.5.1Input signal description and wiring diagram

EC57-K01The bus-type open-closed loop integrated stepper driver provides a programmable interface with photoelectric isolation input.

The input interface adopts common anode connection and only supportsNPNWiring mode, external +24VTo ensure reliable conduction of the optocoupler inside the driver, it is required

The driving current of the controller is at least10mA, the input level pulse width needs to be greater than10msOtherwise, the drive may not respond normally.

The line diagram is shown in the figure3.2,3.3shown.

After the driver is powered on normally, the effective level of the input interface is initially set to rising edge or high level by default. The user can also configure the input interface through the master station.

The initial default effective level of the port is the falling edge or low level. For specific configuration, please refer to4.2Definition and description of registers within the subsection.
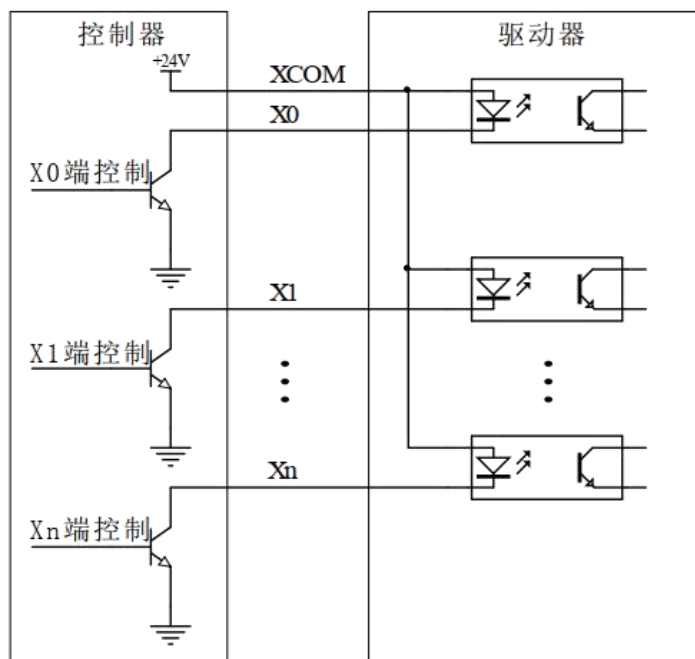

picture3.2Input signal wiring diagram

byNPNFor example, the sensor is connected to the driverX0The wiring diagram of the terminal is as follows:
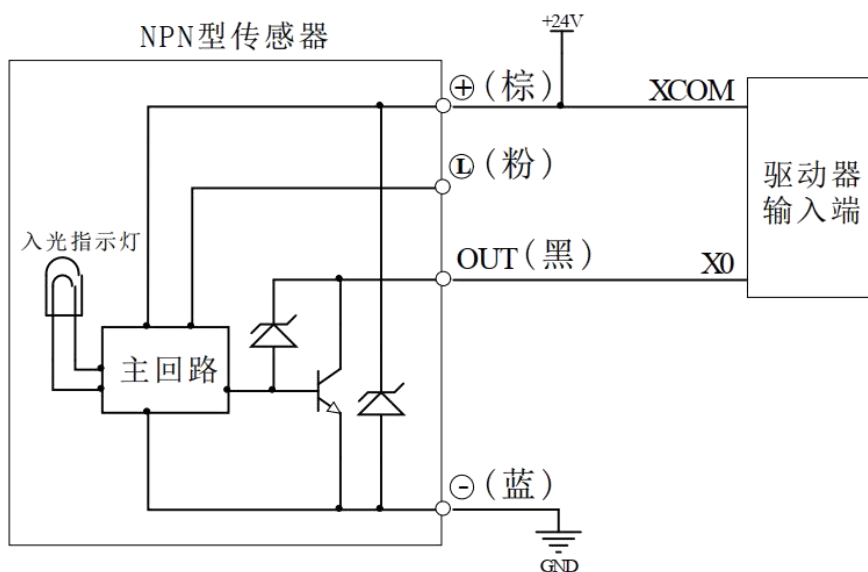

picture3.3 NPNType sensor wiring diagram

Notice:EC57-K01Bus type open and closed loop integrated stepper driver default input interface support24VSignal, if the user needs5VSignal Control

If it is not set, you need to communicate with our business or technical personnel to make changes.

3.5.2Input signal interface function

EC57-K01The bus-type open-closed loop integrated stepper driver has a variety of configurable functions at its input port. Users can set the corresponding

The inputIOport function, each inputIOThe ports can be set up to5Functions, see the table below3.7For specific usage, please refer to chapter4.2

Internal description.

surface3.7Input interface function definition

name		illustrate	Functional Description
IN	X0	Low speed digital signal Input Interface	1: Origin signal 2: Positive limit 4: Negative limit 8: Quick stop 16: Custom
	X1		
	X2		
	X3		
	X4		
	XCOM	Single-ended input common Correct connection is effective	Connect +24VSignal

3.5.3Input signal interface function description

The input signal interface function description is as follows3.8As shown:

surface3.8Input interface function description

Function	describe
1: Origin signal	Connect the origin sensor;
2: Positive limit signal	Connect the positive limit sensor;
4: Negative limit signal	Connect to negative limit sensor;
8: Quick stop signal	Stop the motor;
16: Custom	Users can customize the function of a certain port;

3.6Output signal interface

3.6.1Output signal description and wiring diagram

EC57-K01The bus-type open-closed loop integrated stepper driver provides a programmable interface with optically isolated output.

The output interface is compatible with common cathode and common anode connection, supportingNPNWiring andPNPThere are two wiring methods, which can support high level and low level effective

Master station controller.

After the driver is powered on normally, the effective state of the output interface is initially set to normally open output by default. The user can also configure the effective state of the output interface through the master station.

The default initial state is normally closed output. For specific configuration, please refer to chapter4.2Definition and description of internal registers.

The following figure is a wiring diagram of the output signal interface:
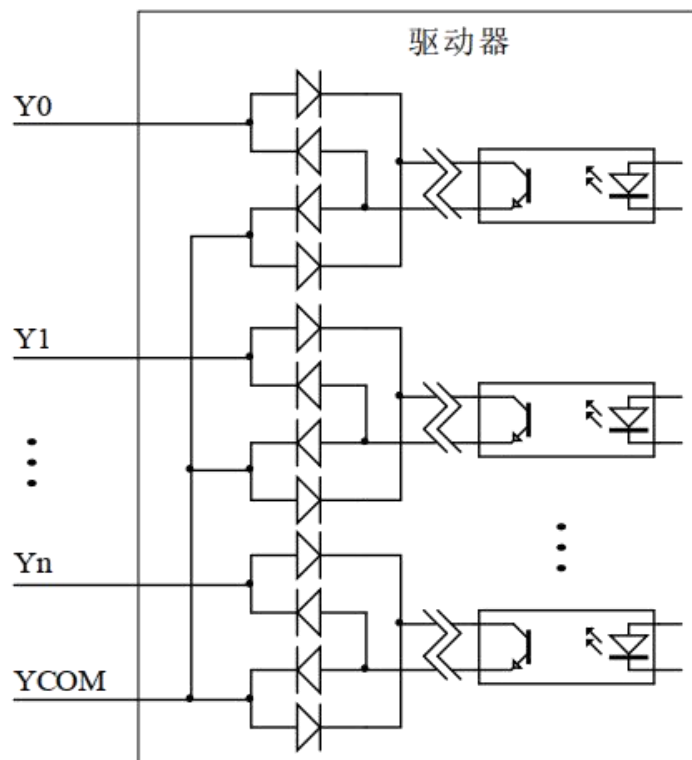

picture3.4Output signal wiring diagram

3.6.2Output signal interface function

EC57-K01The bus-type open-closed loop integrated stepper driver has a variety of configurable functions at its output port. Users can set the corresponding

The output should beIOport function, each outputIOThe ports can be set up to4Functions, see the table below3.9For specific usage, please refer to chapter4.2

Internal description.

surface3.9Output interface function definition

name		illustrate	Functional Description
OUT	Y0	Low speed digital signal Output Interface	1: Alarm output 2: Output in place 4:ZSignal output 8: Master control output (default)
	Y1		
	Y2		
	YCOM	Single-ended output common port Compatible with common cathode and common anode	Compatible with both common cathode and common anode connection

3.6.3Output signal interface function description

The output signal interface function description is as follows3.10As shown:

surface3.10Output interface function description

Function	describe
1: Alarm output signal	When the driver is in alarm state, the signal output is valid;
2: Output signal when in position	When the planned trajectory is completed in position mode, the signal output is valid;
4:ZSignal output	Output encoderZSignal status;
8: Master control output (default)	The master station can control the output of a certain port;

3.7Serial communication signal interface

name		illustrate	Function
UART	RxD	Serial communication interface	Connect to the serial communication interface and need to communicate with the external serial signal line
	TXD		Fork connection
	3.3V	Serial communication power interface	3.3VPower supply positive terminal
	GND		3.3VNegative terminal of power supply

3.8Encoder input signal interface

name		illustrate	Function
Encoder	ENZ+	Encoder interface	Connect encoderA,B,ZSignal, pay attention to the line sequence
	ENZ-		
	ENB+		
	ENB-		
	ENA+		
	ENA-		
	VCC	Encoder power interface	Encoder5VPower supply positive terminal
	GND		Encoder5VNegative terminal of power supply

3.9Motor control output interface

name		illustrate	Function
Motor	A+	Motor interface	Two-phase stepper motor connection port
	A-		If it is a closed-loop motor, pay attention to the line sequence
	B+		
	B-		

3.10Power input interface

name		illustrate	Function
VDC	VDC	Power interface	Power Input DC20V~50V
	GND

X4	2021-bit4	2022:05	2023:05	60FD-bit4	2014-bit4

4.2.2Output signal

The functions of the output port include alarm output, arrival output,ZSignal output, master control output (user-defined), each output port

The functions are available through the object dictionary0x2025Select one of the following table to describeY0-Y2Default output functions and settings.

Output Port	Default functionality	Feature Selection Object Dictionary	Function selection object dictionary Default settings	IOStatus query Object dictionary used1	IOStatus query Object dictionary used2
Y0	Master control output	2025:01	16	60FD-bit0	2014-bit0
Y1	Master control output	2025:02	16	60FD-bit1	2014-bit1
Y2	Master control output	2025:03	16	60FD-bit2	2014-bit2

The following tableY0Taking the port as an example, explain which setting each output function corresponds to.

Y0Port function selection	Function selection bit
Alarm output	2025:01-bit0
Output in place	2025:01-bit1
ZSignal output	2025:01-bit2
Master control output	2025:01-bit4

The object dictionary related to the output port function configuration is listed in the following table. For specific meanings, please refer to the chapter '3.1All parameters' description.

Output Port	Polarity Configuration	Function selection control	Physical output on	Physical output enable 60fe+02
Y0	2024-bit0	2025:01	60FE:01-bit0	60FE:02-bit0
Y1	2024-bit1	2025:02	60FE:01-bit1	60FE:02-bit1
Y2	2024-bit2	2025:03	60FE:01-bit2	60FE:02-bit2

For example: SettingY2If it is set as custom output function, the setting steps are as follows:

（1）First set0x2025Sub-index03The value of16(User-defined output function);

（2）set up60FE:01,60FE:02All for4,at this timeY2Output signal;

5. Common functions

5.1Parameter saving and factory reset

Towards0x1010Corresponding sub-index write command0x65766173, the corresponding category parameters can be saved toEEPROMin0x1011

Corresponding sub-index write command0x64616f6c, you can restore the factory settings of the corresponding category parameters. After writing the save command, do not close it immediately.

Power supply, especially when saving all parameters, you need to wait until the 'red indicator light' goes out before turning off the power to ensure that all parameters are saved successfully.

Function	Object Dictionary	Order	Result Status	Remark
saveCia402Series parameters	1010:04	0x65766173	return1	
Save factory-defined parameters	1010:03	0x65766173	return1	
Save communication parameters	1010:02	0x65766173	return1	
Save all parameters	1010:01	0x65766173	return1	Serial port is the button for saving parameters
recoverCia402Series parameters	1011:04	0x64616f6c	return1	
Restore factory customized parameters	1011:03	0x64616f6c	return1	
Restore communication parameters	1011:02	0x64616f6c	return1	
Restore all series parameters	1011:01	0x64616f6c	return1	The serial port is the restore parameter button

5.2Control word and status word bit definition

5.2.1 6040Control Word

Bit	0	1	2	3	4-6	7	8	9-15
Function	start up	powered by	Emergency Stop	Enable operation	Operation mode related	Reset Error	pause	-

Additional notes for other positions:

Bit2: The quick stop trigger logic is0Valid, please distinguish it from other triggered logic.

Bit7: Error reset trigger logic is rising edge effective

Bit5: Immediate trigger trigger logic is rising edge effective

5.2.2 6041Status word

Bit	0	1	2	3	4	5	6	9	11	7,8, 10..
Function	Ready to start move	start up	Allow to operate do	mistake	Power on	Quick stop end	Not started	remote	Limit effect	Mode Phase close

Additional notes for other positions:

When the drive is powered on4Will be set.

Bit5: Rapid stop activated, is in the logic0The logic of this bit is opposite to that of other bits.

Bit9: Remote, display the communication state machine status,ProOPThe following time is0, at this time the control word (6040h)The command will not be executed.

Bit11: Limit, set only when the hardware limit is valid.

Bit8: Abnormal stop, generally valid in hardware limit, deceleration stop and quick stop triggering states.

Bit12：Follow the main station,CSPIf the drive is not enabled or no longer follows the master's instructions, the position0.

Bit10: With position15Set at the same time, indicating that the origin has been found

5.3Control mode and associated object dictionary

Control Mode	Index + Sub-index	name	Data Types	Read and write permissions	unit
Synchronous Position Mode (CSP)	6040	Control Word	UINT16_t	R W	-

Additional notes for other positions:

PPWhen the mode changes position, the control word needs to bebit5The rising edge can start the new position movement;

5.5Return to origin mode

EC57-K01The zero return methods currently supported by the series drive products are:1-14,17-30,33,34,35,37、(-1)-(-6), these models

The method requires the use of positive and negative limits, origin orZSignal.

Among them, the method1-2For limit +ZSignal return to zero mode, mode3-6is the origin+ZSignal return to zero mode, mode7-10Origin + positive limit + ZSignal return to zero mode, mode11-14Origin + negative limit +ZSignal return to zero mode, mode17-18It is the positive and negative limit return to zero mode.19-22

It is the origin return method.23-26It is the origin + positive limit return to zero mode.27-30It is the origin + negative limit return to zero mode.33and34

forZSignal return to zero mode, (-1)-(-6) is the stall return to zero mode in closed loop mode. Users need to select the appropriate return to origin mode according to actual application.

The following only introduces the zero return method.17-30,33,34、(-3)-(-6)The specific process of returning to the origin is shown in the following diagram.

The method is the same as the above return to zero method, only addingZSignal origin, for details, please see5.5.21Described in section.

高速找原点

Icon explanation: 低速找原点
Note: In the following schematic diagrams defining all return-to-zero methods, movement to the right is positive movement, and movement to the left is negative movement.

5.5.1Way17(Negative limit return to zero)

The origin stop position of 'Negative limit return to zero' is at the negative limit signal.

The whole action of 'negative limit return to zero' is divided into two cases, as follows:
ConditionA：After the drive receives the 'home enable signal' command, it will start at the 'home speedV1', 'Return to origin acceleration and deceleration time' several parameters open

Starts to move, and when encounters the rising edge of the limit signal, it decelerates and stops. Then it returns to the origin speedV2'Run in the opposite direction until the limit signal is met.

At the falling edge, deceleration stops and the entire return to zero action is completed.

ConditionB：After receiving the 'Home Enable Signal' command, the drive is within the limit and willV2','Return to the original

Click the 'acceleration/deceleration time' parameter to start the movement. When the falling edge of the limit signal is encountered, the movement will be decelerated and stopped, and the whole return to zero action is completed.

5.5.2Way18(Positive limit return to zero)

The origin stop position of 'Positive limit return to zero' is at the positive limit signal.

'Positive limit return to zero' is similar to 'Negative limit return to zero', except that the running direction is opposite, so it will not be explained in detail here.
5.5.3Way19(Return to zero1)

'Return to zero1'The origin stop position is on the left side of the rising edge of the origin signal in the positive direction.

'Return to zero1'The whole action is divided into two cases, as follows:

ConditionA：After the drive receives the 'home enable signal' command, it will start at the 'home speedV1', 'Return to origin acceleration and deceleration time' and other parameters

Move in the positive direction, and when it encounters the rising edge of the origin signal, it decelerates and stops. Then it returns to the origin speedV2'Run in the opposite direction until it encounters the origin signal

When the signal falls, the deceleration stops and the whole return to zero action is completed.

ConditionB：After receiving the 'home enable signal' command, the drive is in the home signal, and willV2','Back

The origin acceleration/deceleration time and several parameters move in the opposite direction. When the origin signal falls, the deceleration stops and the whole return to zero action is completed.

5.5.4Way20(Return to zero2)

'Return to zero2'The origin stop position is on the right side of the rising edge of the origin signal in the positive direction.

'Return to zero2'The whole action is shown in the figure below. No detailed description is given here.
5.5.5Waytwenty one(Return to zero3)

'Return to zero3'The origin stop position is on the right side of the rising edge of the origin signal in the reverse direction.

'Return to zero3'The whole action is similar to 'return to zero1'The difference is that the initial running direction is opposite. No detailed description will be given here.
5.5.6Waytwenty two(Return to zero4)

'Return to zero4'The origin stop position is on the left side of the rising edge of the origin signal in the reverse direction.

'Return to zero4'The whole action is similar to 'return to zero2'The difference is that the initial running direction is opposite. No detailed description will be given here.
5.5.7Waytwenty three(Origin + positive limit return to zero1)

'Origin + positive limit return to zero1'The origin stop position is on the left side of the rising edge of the origin signal in the positive direction.

'Origin + positive limit return to zero1'The whole action is divided into three cases, as follows:

ConditionA：After the drive receives the 'home enable signal' command, it will start at the 'home speedV1', 'Return to origin acceleration and deceleration time' and other parameters

Move in the positive direction, and when it encounters the rising edge of the origin signal, it decelerates and stops. Then it returns to the origin speedV2'Run in the opposite direction until it encounters the origin signal

When the signal falls, the deceleration stops and the whole return to zero action is completed.

ConditionB：After the drive receives the 'home enable signal' command, it will start at the 'home speedV1', 'Return to origin acceleration and deceleration time' and other parameters

Move in the positive direction, and stop immediately when encountering the rising edge of the positive limit signal. Then return to the origin at the speedV2'Run in the opposite direction until you reach the origin

When the signal falls, the deceleration stops and the entire return to zero action is completed.

ConditionC：After receiving the 'home enable signal' command, the drive is in the home signal, and willV2','Back
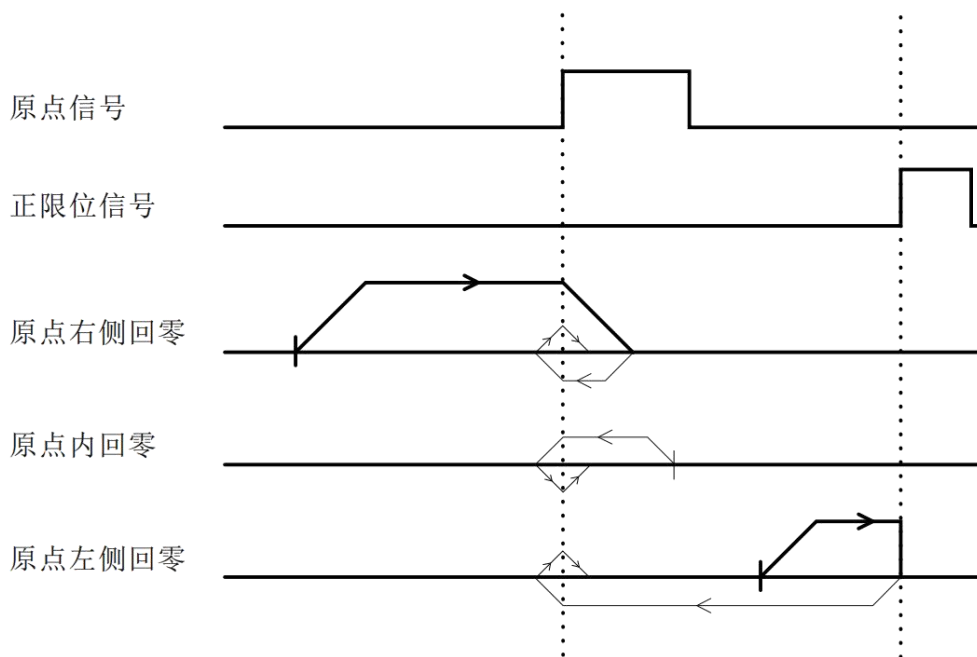

The origin acceleration/deceleration time and several parameters move in the opposite direction. When the origin signal falls, the deceleration stops and the whole return to zero action is completed.

5.5.8Waytwenty four(Origin + positive limit return to zero2)

'Origin + positive limit return to zero2'The origin stop position is on the right side of the rising edge of the origin signal in the positive direction.

'Origin + positive limit return to zero2'The whole action is shown in the figure below. No detailed description is given here.

5.5.9Way25(Origin + positive limit return to zero3)

'Origin + positive limit return to zero3'The origin stop position is on the left side of the falling edge of the origin signal in the positive direction.

'Origin + positive limit return to zero1'The whole action is divided into three cases, as follows:

ConditionA：After the drive receives the 'home enable signal' command, it will start at the 'home speedV1', 'Return to origin acceleration and deceleration time' and other parameters

Move in the positive direction. When the origin signal rises, the machine continues to run. When the origin signal falls, the machine slows down and stops. Then the machine returns to the original position.

Origin speedV2'It runs in the opposite direction until it encounters the rising edge of the origin signal, then decelerates and stops, and the entire return to zero action is completed.

ConditionB：After the drive receives the 'home enable signal' command, it will start at the 'home speedV1', 'Return to origin acceleration and deceleration time' and other parameters

Move in the positive direction, and stop immediately when encountering the rising edge of the positive limit signal. Then return to the origin at the speedV2'Run in the opposite direction until you reach the origin

When the signal rises, the deceleration stops and the entire return to zero action is completed.

ConditionC：After receiving the 'home enable signal' command, the drive is in the home signal, and willV1','Back

The origin acceleration and deceleration time's several parameters move in the positive direction, and when they encounter the falling edge of the origin signal, they decelerate and stop. Then they return to the origin speedV2'

It runs in the opposite direction until it encounters the rising edge of the origin signal, then decelerates and stops, and the entire return to zero action is completed.

5.5.15Way33(ZSignal return to zero1)

This zero return method isZThe signal is used as the zero return detection signal, which is consistent with the direction of 'negative limit return to zero'. The origin stop position isZSignal right.
'ZSignal return to zero1'The whole action is shown in the figure below. No detailed description is given here.

5.5.16Way34(ZSignal return to zero2)

This zero return method isZThe signal is used as the zero return detection signal, which is consistent with the direction of 'positive limit return to zero'. The origin stop position isZLeft side of signal.

'ZSignal return to zero2'The whole action is shown in the figure below. No detailed description is given here.
5.5.17Way -3(Stall return to zero1)

The motor initially returns to the origin speedV1'Running in the forward direction, after a stall occurs, the motor decelerates to stop and moves in the reverse direction. After the motor dynamic torque disappears,

Decelerate to a stop and use this position as the origin.

The entire action of this zero return method is shown in the figure below. No detailed description is given here.

5.5.18Way -4(Stall return to zero2)

The motor initially returns to the origin speedV1'Running in the opposite direction, after a stall occurs, it decelerates to stop and moves in the opposite direction. After the dynamic torque of the motor disappears,

Decelerate to a stop and use this position as the origin.

The entire action of this zero return method is shown in the figure below. No detailed description is given here.

5.5.19Way -5(Stall return to zero3)

The motor initially returns to the origin speedV1'When running in the positive direction and a stall occurs, the machine stops immediately and takes that position as the origin.
The entire action of this zero return method is shown in the figure below. No detailed description is given here.

5.5.20 Way -6(Stall return to zero4)

The motor initially returns to the origin speedV1'If the machine runs in the reverse direction and a stall occurs, it stops immediately and takes that position as the origin.

The entire action of this zero return method is shown in the figure below. No detailed description is given here.

堵转信号

堵转回零
5.5.21 Other return to zero methods

The above section introduces the return to zero method17-30,33,34、(-3)-(-6)The other zero return methods are similar to the above zero return methods.

As shown in the following table:

Zero return method	Similar return to zero method	describe
1	17	
2	18	
3	19	
4	20	
5	twenty one	
6	twenty two	
7	twenty three	
8	twenty four	After finding the positive and negative limits or the origin limit, continue running to detect the first
9	25	
10	26	indivualZThe signal is used as the zero position;
11	27	
12	28	
13	29	
14	30	
- 1	3	
- 2	4	
35,37	none	Take the current position as the zero position;

0x8223	0x10	Slave station needsSafe-OPstate	0x1023	1	4Second-rate

8. Warranty and after-sales service

8.1Warranty

8.1.1Free warranty situation

Our company solemnly promises that if any of our products are damaged during use due to the product itself, we will provide

One year free maintenance service. The shipping cost of the product shall be borne by both parties.

8.1.2Warranty void

（1）The driver is damaged due to the customer's own wiring error;

（2）Exceeding the rated working voltage causes damage to the driver;

（3）The DC power supply driver is connected to the AC power supply, causing the driver to be damaged;

（4）Due to the extremely bad environment on the customer's site, such as humidity, extreme cold, extreme heat, etc., the customer did not inform our company in advance, resulting in

The drive is damaged;

（5）The customer dismantles the drive casing without permission or the serial label number is torn off;

（6）After the customer confirms receipt15Days later, the casing was obviously damaged or hit, causing damage to the drive;

（7）Force majeure natural disasters, such as fire, earthquake, tsunami, typhoon, etc.;

In the above cases, our company will charge a certain amount of repair cost after evaluating the interests of all parties. In other cases, repairs will be provided free of charge forever.

8.2Exchange

8.2.1Product defect replacement

For faults in new products, our company provides three months of free replacement service.

After our technical support staff confirms that the problem is with the product itself, they will send the product back to our company to avoid wasting time and postage on the round-trip.

The customer needs to send the defective product back by express or logistics first. After receiving it, our company will send another new product back to the customer as soon as possible.

Notice: All our products are strictly tested and aged before leaving the warehouse, so it is extremely rare for new products to fail.

Please be sure to read the instructions carefully or consult our technical support staff when operating, or our technical support staff will assist customers in operating remotely.

- **Please note the following points when exchanging goods:**

（1）Please ensure that the packaging is complete when sending back to avoid damage during transportation;

（2）Please ensure that the attached accessories are complete when exchanging goods;

（3）Each driver should be packed in its original box to avoid secondary damage to the product during transportation;

（4）If the driver is returned and it is confirmed that the fault is not due to product failure, but due to the customer's negligence in operation, then

The company does not bear the freight (the customer's own negligence includes: connecting the wrong line and causing the driver to be damaged, poor wiring and mistaking the driver for damage,

Operation errors causing the drive to fail to function properly, etc.).

8.2.2Exchange for non-product fault

If the customer is not satisfied with the appearance or function of the product received and wants to replace it with a better driver, he or she can contact us within one week after receiving the product.

The company applies for a replacement service. After verification, the company will return the product. The company will confirm that the returned product has no damage, complete accessories, and

If the product is in good condition, we will replace it with another product. If there is a price difference between the replaced products, the customer shall make up the difference.

Note: The replaced product will no longer be eligible for the non-product failure replacement service. The round-trip shipping and other fees incurred by the non-product failure replacement service

All costs are borne by the customer!

8.3return the goods

Our company provides7Days return service, if you receive this product7Days (subject to the actual date of receipt by the customer)

If there are any quality problems with the product itself, please communicate with our salesperson or technical support personnel in time.

After the quality problem of the product itself is found, the customer will send the original complete product and its inner and outer packaging, accessories and shipping order back to our company by express or logistics.

If the customer still insists on returning the goods after our company has checked and confirmed that they are correct, the round-trip shipping costs and all other costs incurred will be borne by the customer.

At your own expense.

- **Please note the following points when returning goods:**

（1）Please contact the relevant department of our company before making a refund;

（2）The product must be in new condition and complete packaging. Please send it back to our company by express or logistics;

（3）Problems caused by customers such as damaged product appearance, incomplete accessories, etc. will not be accepted;

8.4After-sales service

If customers encounter technical problems when using this product, please contact our company immediately. Please call our national toll-free

Service Hotline:0755-23206995.

Service time: Monday to Saturday8:30-17:30(Except national holidays).
