#### 1. Product Introduction

#### 1.1Product Overview

IRSS7EAII-in-one485The bus-type closed-loop stepper driver is the latest product with serial port debugging function launched by Shenzhen Ge Rui IoT Technology Co., Ltd.

Digital hybrid step servo drive with integratedMODBUS-RTUStandard protocol specification, power supply interface adoptsXH2.54-2PNeedle holder,

IOInput and output ports and communication interfaces adoptPHB2.0-2×6PThe user can set the subdivision, current, speed,

Various parameters such as working mode have greatly enriched the practical functions of the product and can meet the application needs of most occasions.

IRS57EAll-in-one485The bus-type closed-loop stepper driver adopts a servo-like control principle and is compatible with both open-loop stepper and servo systems.

Advantages, using the latest 32BitDSPC ontrol technology has greatly improved the performance of the stepping system. Both medium and low speeds have excellent stability and ultra-low and low speeds have exce

Noise, high-speed torque is also greatly improved, expanding the speed application range of stepper motors. Smooth and precise pure sine current vector control technology

The technology effectively reduces the heating of the motor, and has strong compatibility and high cost performance, which can meet the application needs of most occasions.

#### **1.2Product Features**

- ew Generation32BitDSPTechnology, good stability, strong compatibility, high cost performance
- upport open-loop and closed-loop mode switching
- Oupport speed mode, position mode, multi-segment position/speed mode, JOG+, JOG-And return to origin mode
- urrent, lock current, subdivision, PIParameters such as these can be set and queried through the master station
- seRS485Bus, with isolation, supports standardMODBUS-RTUprotocol
- ialSW1-4Set the driver communication address to support15Devices, more can be set via the master station
- 34 opto-isolated programmable input interfaces receive external control signals to implement driver enable, start/stop, limit and other functions
- 14-way photoelectric isolation programmable output interface, output driver status and control signals, such as alarm, arrival, return to origin completion, etc.
- uilt-in micro-segmentation, excellent low-speed stability
- fith over-current (reserved), over-voltage, under-voltage, phase loss, out-of-tolerance and other alarm protection functions
- Oure sinusoidal current vector control effectively reduces motor heating
- ©C power supply, input voltage range:DC12V~50V

### 1.3Application Areas

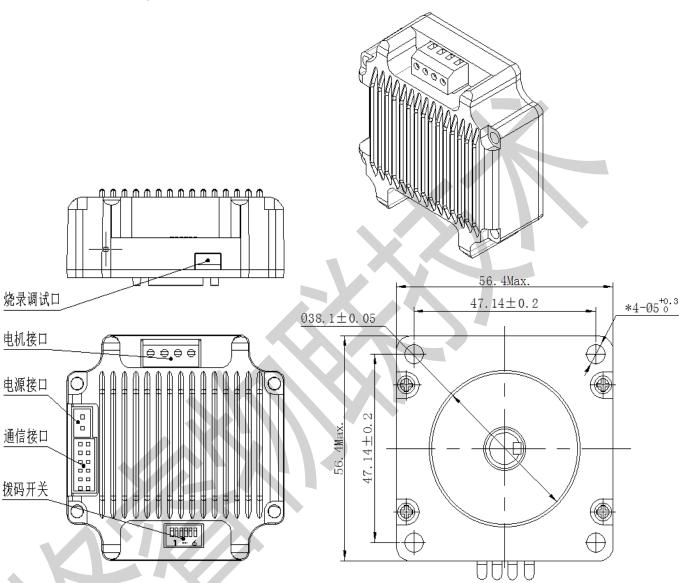

Suitable for various small and medium-sized automation equipment and instruments, such as: engraving machines, marking machines, cutting machines, plotters, CNC machine tools, automatic

It is particularly effective in equipment applications where users expect low noise and high speed.

#### 2. Mechanical, electrical and environmental indicators

#### 2.1Mechanical installation drawing

picture1Installation Dimensions (Unit:mm)

# 2.2Installation Notes

1) When installing the integrated stepper driver, do not knock on the rear cover of the motor to avoid affecting the running performance. When designing the installation dimensions, consider the wiring

## Terminal size and wiring.

2) In order to ensure good heat dissipation conditions, a larger installation interval must be reserved as much as possible during actual installation. If multiple integrated drives are installed side by side,

A fan can be installed to form a strong air convection on the surface of the integrated driver to assist the driver in heat dissipation and ensure that the driver is at a reliable working temperature.

Work within the scope.

#### 2.3Electrical specifications

	IRS57EAll-in-one485Bus type closed loop stepper driver			
illustrate	Minimum	Typical Value	Maximum	unit
Output Current	0	-	6000	mA
Input power voltage	12	twenty four	50	VDC
Control signal input current	7	10	16	mA
Insulation resistance	50	-	-	ΜΩ

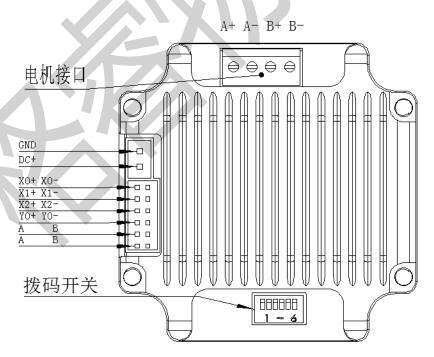

#### 2.4Use environment and parameters

Cooling method		Natural cooling, fan cooling
	occasion	Do not place it near other heating equipment. Avoid dust, oil mist, corrosive gas, high humidity
	occusion.	and strong vibration. Do not place it near flammable gas and conductive dust.
Usage Environment	temperature	- 25°C~55°C
	humidity	40~90%RH
	vibration	10~55Hz/0.15mm
Storage te	mperature	- 25°C~65°C

# 3. Driver interface and wiring description

### 3.1Product interface general description

Communication interfacePHB2.0-2×6PStraight pin socket, as shown below3.1Shown

picture3.1 IRS57EInterface Diagram

The function of each pin is described in the following table3.1shown.

surface3.1General description of interface functions

name	illustrate
GND	Negative pole of power supply
DC+	Positive pole of power supply, range:DC12~50V
X0+ X0-	DC 5V~24VPower supply, connect external input signal, support differential input
X1+ X1-	DC 5V~24VPower supply, connect external input signal, support differential input
X2+ X2-	DC 5V~24VPower supply, connect external input signal, support differential input
Y0+ Y0-	Opto-isolated programmable output interface (maximum drive current50mA)

## 3.2.1Drive address setting

Host computer useRS485Bus communication. The maximum controllable15tower485Drive, The drive communication address isSW1-SW4

Dial setting,offrepresent0,onrepresent1Each dial corresponds to a hexadecimal data, the address range is1-15, as shown in the table3.3shown.

When the drive address is set greater than15When the host needs to send a change address command to set it, but before setting it,SW1-SW4Dial

All set tooffAfter the setting is completed and saved, you need to power on again to take effect.

Note: Make sure the communication address of each drive is unique, otherwise it will cause communication conflicts!

surface3.3Drive address setting

SW1	SW2	SW3	SW4	
on=1 off=0	on=1 off=0	on=1 off=0	on=1 off=0	Add(7D)
×	×	×	×	=Address(ID)
1	2	4	8	
off	off	off	off	1(Customizable)
on	off	off	off	1
off	on	off	off	2
on	on	off	off	3
off	off	on	off	4
on	off	on	off	5
off	on	on	off	6
on	on	on	off	7

off	off	off	on	8
on	off	off	on	9
off	on	off	on	10
on	on	off	on	11
off	off	on	on	12
on	off	on	on	13
off	on	on	on	14
on	on	on	on	15

#### 3.2.2Communication baud rate setting

The communication baud rate can be set by SWSSettings, as shown in the following table 3.4 If the communication baud rate in the table cannot meet the use requirements, you can

The baud rate of the communication is customized by the computer.SW5Dial tooffStatus, see register for details0x0015Description.

surface3.4Communication baud rate setting

SW5	Baud rate	
off	9600(Customizable)	
on	115200	

#### 3.2.3Terminal resistance setting

Users can dialSW6Select whether the communication terminal is incorporated 120ΩThe terminal resistance is determined according to the application scenario, as shown in the following table3.5shown.

surface3.5 120ΩTerminal resistance selection

SW6	120ΩTerminal resistance	
off	invalid	
on	efficient	

# 3.2.4Current setting

 $IRS57EAll-in-one 485 Bus \ type \ closed \ loop \ stepper \ driver, the \ default \ current \ in \ closed \ loop \ or \ open \ loop \ mode \ is \ as \ follows 3.6 It \ cannot \ be$ 

The current size is set by the dial code. If the user wants to adjust the current size by himself, it can be set through the host computer software.

surface3.6Open and closed loop default current size

	Open Loop		closed loop	
Current setting	Peak(A)	RMS(A)	Imin(A)	Imax(A)
default	4.2	3.0	1.0	3.5

#### 3.3Indicator Lights

IRS57EAll-in-one 485 The indicator light of the bus-type closed-loop stepper driver is a retractable patchled Its basic functions are as follows 3.7 shown.

surface3.7Indicator lamp definition

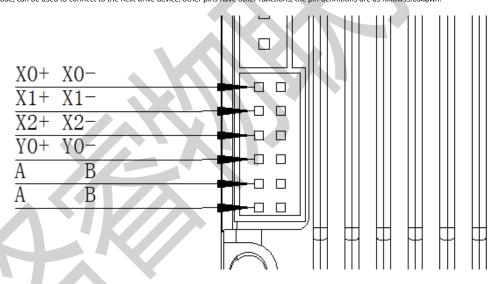

name	Function	illustrate
greenled	Power supply, parameter saving function indication,	When the power is on normally, the green light is always on and the red light is off.
<b>3</b> · · · - ·	Restore factory settings function indication,	number, restore factory settings, switch the dial status,
redled	DIP switch status indication,	When an abnormality occurs in the equipment, the red and green lights flash alternately to give an alarm
	Alarm indicator light	For the flashing pattern, please refer to Chapter 6;

#### 3.4 RS485Communication interface

Its interfaces have12Pins, from left to right, corresponding pins from top to bottom1~12, where pin9,10,11,12Used forRS485of

Half-duplex communication, pin9,10As a group,485CommunicationA,BTerminal, Pin11,12As a group, the driver internally connects to the pins9,

10Cascade, can be used to connect to the next drive device, other pins have other functions, the pin definitions are as follows3.8shown.

picture 3.2 IRS57EAll-in-one 485Bus type closed loop stepper driver interface diagram

### 3.5Input signal interface

### 3.5.1Input signal description and wiring diagram

 $IRS57EAll-in-one 485 Bus-type\ closed-loop\ stepper\ drives\ provide 3 The\ input\ is\ a\ programmable\ interface\ with\ opto-isolation.$ 

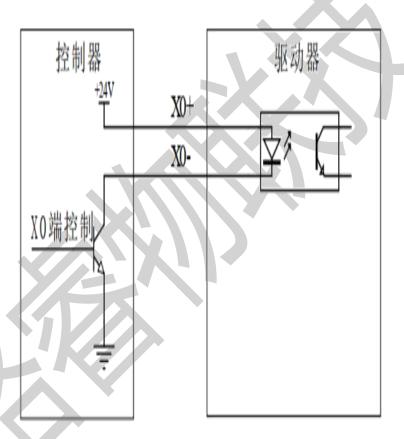

Input interface can be externally connected5V-24VTo ensure reliable conduction of the optocoupler inside the driver, the drive current at the controller end is required to be at least

10 mA, the input level pulse width needs to be greater than 10 ms, otherwise the drive may not respond properly.

After the driver is powered on normally, the effective level of the input interface is initially set to rising edge or high level by default. The user can also configure the input interface through the master station.

The initial default valid level of the port is the falling edge or low level.

 $by XOT a king \ the \ input \ port \ as \ an \ example, the following \ figure \ is \ the \ wiring \ diagram \ of \ the \ input \ signal \ interface:$ 

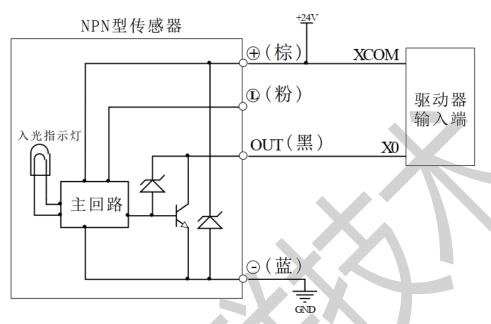

picture3.3Input signal wiring diagram

 $Notice: IRS57EAll-in-one 485 Bus\ type\ closed\ loop\ stepper\ driver\ default\ input\ interface\ support DC\ 5V\sim24V Signal,\ no\ external\ resistor\ is\ required.$ 

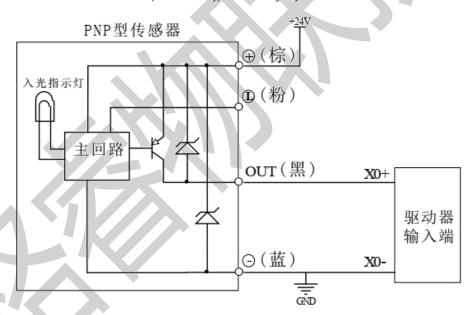

If the input terminal is connected to a sensor, it supportsNPNType and PNPThere are two types of sensor wiring methods:X0For example, the input port is

The line diagram is shown in the following two figures

picture3.4 NPNType sensor wiring diagram

picture3.5 PNPType sensor wiring diagram

### 3.5.2Input signal interface function

IRS57EAll-in-one485The bus-type closed-loop stepper driver has a variety of configurable functions on its input port. Users can set

The corresponding input IOport function, each input IOThe ports can be set up to twenty one Functions, see the table below 3.9 shown.

surface3.9Input interface function definition

name		illustrate	Functional Description			
			0: undefined;

			twenty one: Clear the in-place output signal;			
			Note: In the above function selection:4,5,12,			
	X2-		13, 15-20The signal is high or low level valid.			
			They are all valid on the rising or falling edge;			

## 3.5.3Input signal interface function description

The input signal interface function description is as follows3.10As shown:

surface3.10Input interface function description

Function	describe	
1: Origin signal	Connect the origin sensor;	
2: Positive limit signal	Connect the positive limit sensor;	
3: Negative limit signal	Connect to negative limit sensor;	
4: Motor enable/release signal	Enable signal, which makes the motor enter the lock or release state;	
5: Brake control input signal	Control the brake motor to hold or release the brake;	
6: Alarm clear signal	EEPROMRead and write errors, communication errors recovery,  Automatic recovery from overvoltage and undervoltage;	
7: Parameters are restored to factory settings signal	Parameters are restored to factory settings;	
8: Normal stop signal	The motor decelerates and stops;	
9: Emergency stop signal	The motor not only over-decelerates but stops directly;	
10: Trigger position mode motion	By Register0x0030~0x0036Set up movement;	
11: Trigger speed mode motion	By Register0x0030~0x0036Set up movement;	
12:JOG+Point movement	By Register0x0046~0x0049Set up movement;	
13:JOG-Point movement	By Register0x0046~0x0049Set up movement;	
14: Return to origin enable signal	Trigger the return to origin function;	
15:PTIN0	XXI	
16:PTIN1	7 7	
17:PTIN2	Multi-segment mode path number setting;	
18:PTIN3		
19:PTIN4(reserve)		
20: Multi-stage mode start signal	Start multi-stage mode motion;	
twenty one: Clear the in-position output signal	If the output port in-place signal function is enabled, this function can be used to clear the in-place output.	
	Send out a signal;	

### 3.6Output signal interface

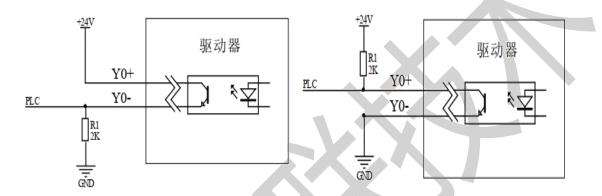

### 3.6.1Output signal description and wiring diagram

 $IRS57EAll-in-one 485 Bus-type\ closed-loop\ stepper\ drives\ provide 1 Output\ programmable\ interface\ with\ opto-isolation.$ 

After the driver is powered on normally, the effective state of the output interface is initially set to normally open output by default. The user can also configure the effective state of the output interface through the master station.

The effective state is initially defaulted to normally closed output.

The following figure is a wiring diagram of the output signal interface:

picture3.6Schematic diagram of normally closed connection of output interface

picture3.7Output interface normally open connection diagram

# 3.6.2Output signal interface function

IRS57EAll-in-one485The bus-type closed-loop stepper driver has a variety of configurable functions at its output port. Users can set

 $The corresponding \ output IO port \ function, each \ output IO The \ ports \ can \ be \ set \ up \ to 11 Functions, see the \ table \ below 3.11 shown.$ 

surface3.11Input/output interface function definition

name	illustrate	Functional Description	
		0: undefined;	
KLYV		1: Alarm output signal (0:normal1:Call the police); 2: In-	
Y0-	•	position output signal(0: Not in place1: in place); 3:Lock	
		shaft status signal (0:release1: lock axis); 4: Motion status	
		signal(0:still1:sports); 5: Home return completion signal (0:	
Output	Low speed digital signal	Not completed1:Finish); 6: Conducting origin signal;

		7: Conducting positive limit signal;	
Y0-	-	8: Conduct negative limit signal;	
		9: Brake control signal(0: Brake1: Release the brake);	
		10:ZSignal output;	
		11: Brake controlPWMAdaptive output signal (reserved);	

#### 3.6.3Output signal interface function description

The output signal interface function description is as follows3.12As shown:

surface3.12Output interface function description

Function	describe
1: Alarm output signal	When the driver is in alarm state, the signal output is valid;
2: Output signal when in position	When the planned trajectory is completed in position mode, the signal output is valid;
3: Lock axis status signal	When the motor is in the shaft-locked state, the signal output is valid;
	When the motor is in running state, the signal output is valid;
4: Motion status signal	Note: The valid level state will be maintained for at least20msSo that the master can
	Detection obtained;
5: Return to origin completion signal	After returning to the origin, the signal output is valid;
6: Conduction origin signal	When reaching the origin position, the signal output is valid;
7: Conducting positive limit signal	When reaching the positive limit position, the signal output is valid;
8: Conducting negative limit signal	When the negative limit position is reached, the signal output is valid;
	When the external input brake control signal or the host computer sets the brake control signal
9: Brake control signal	After the signal is received, the output of this bit is valid:
10:ZSignal output	Output encoderZSignal status;
	For drivers with dedicated brake output circuits, this can be configured as
11: Brake controlPWMAdaptive output signal (reserved);	This output function directly connects the brake to the brake output port for control;

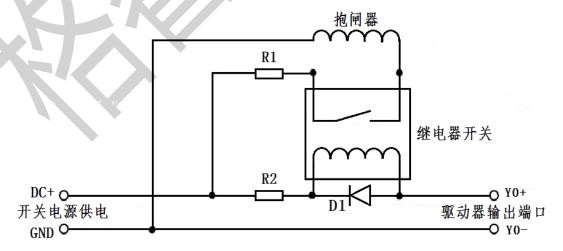

# 3.6.4Brake motor brake wiring diagram

IRS57EAll-in-one485The output port of the bus-type open-loop and closed-loop stepper driver includes the control function of the brake motor brake.

The host computer sets one of the output functions in the 'output port function selection' register to 'brake control signal', and then sets the 'brake control parameter

The registers in the 'group' can control the brake motor brake.

The following figure is a wiring diagram of the brake motor brake (Table3.13For the relevant parameter description in the schematic diagram)

picture3.8Brake motor brake wiring diagram

 $surface 3.13 Brake\ motor\ holding\ brake\ connection\ diagram\ parameter\ description$ 

name	Logo	illustrate	
	DC+	Connect +twenty fouror +5Vpower supply	
Switching power supply	GND	Ground terminal	
	Y0+	The common end of the single-ended output port is compatible with common cathode and common ar	
Driver output port	Y0-	One of the output ports needs to be configured as the 'brake control signal' function	
		If the brake isDC24VPower supply, thenR1You can select a smaller one	
Protection resistor	R1	or not connect it; if the brake isDC5VPower supply, thenR1Select	
		It should be larger;	
		R2Acceptable1~2KThe resistor limits the current to prevent damage to the driver	
Protection resistor	R2	The optocoupler element of the part;	
		You can refer to the relay specification to determine whether it needs to be connected;	
Freewheeling diode	D1	Protect the internal components of the driver from being damaged by induced voltage;	
Treewiteeling diode	<b>-</b> .	You can refer to the relay specification to decide whether it needs to be connected;	
		The control mechanism with brake motor usually operates after the power is turned on.	
Brake		In the release state, the motor can run freely.	
		The power supply voltage should be controlled to avoid overvoltage that may burn out the brake device.	

## 3.7Motor control output interface

		Deceleration time and return to original compensation value parameters;		
		1: Select the speed, acceleration and deceleration time of this path segment		
		Time, return to original compensation value parameters;		
		Bit3-Bit7:reserve;		
		Bit8~Bit15: Return to origin mode selection position; return to origin		
		For details, see chapter '5.3Back to origin mode';		
		In the multi-segment position mode, it is used to set the path segment operation.		
		The total number of pulses in the line, including acceleration, uniform speed, and deceleration		
		Total number of steps in the three phases;		
0x0062	path0Location segment	The highest bit represents the sign bit, and a positive number indicates positive direction.		
	Total pulse count low	The negative number indicates the pulse number of the reverse direction.		
		Number of impulses;		
		Note:If set100000(Original code:0x0001 86A0)	- 2147483648~	
		pulses, the high bit set value is0x0001,Low	2147483648	0
		The bit value is0x86A0;	(Read and Write)	
		If set -100000(Original code:0x8001 86A0)indivual		
	path0Location segment	Pulse, because negative numbers are stored in the form of complement code,		
0x0063	Total pulse count high	The high setting value is0xFFFE, the low given value is		
	,	0x7960;		
		The given pulse number in the reverse direction can be calculated using the following formula:		
		2.32-abs(The number of pulses given in the reverse direction)		
		(1) In multi-stage position/speed mode, set the corresponding		
		The maximum speed at which the motor runs within the path;		
		(2) If the path segment has the return to origin function enabled, and		
		Register' path function setting2'ofBit2Location1,		
		Then the speed of returning to the originV1'Use this register value;		
0x0064	path0Run/Return to origin	unit:rev/min	- 3000~3000	60
0x0064	Maximum speed	Note: (1) In multi-speed mode, according to the setting	(Read and Write)	00
		The positive or negative value determines the direction of the motor's rotation; a negative value	e	
		For setting rules, please refer to register		
		'0x0034~0x0035Total number of pulses' introduction;		
		(2) Multi-position mode and zero return speed setting		
		The value must be guaranteed to be positive;		
		(1) In multi-stage position/speed mode, set the corresponding		
		The starting speed of the motor within the path;		
0,006	path0Run/Return to origin	(2) If the path segment has the return to origin function enabled, and	1~3000	_
υχυυο5	Starting speed	Register' path function setting2'ofBit2Location1,	(Read and Write)	5
		Then the speed of returning to the originV2'Take this value;		
		unit:rev/min		
0x0065		(1) In multi-stage position/speed mode, set the corresponding  The starting speed of the motor within the path;  (2) If the path segment has the return to origin function enabled, and  Register' path function setting2'ofBit2Location1,  Then the speed of returning to the originV2'Take this value;		5

		1K337 E TITLEGI ALEU 463 BUS CIOS		
		(1) In multi-stage position/speed mode, set the corresponding		
		Acceleration time within the path;	0. 2000	
0x0066	path0Run/Return to origin	(2) If the path segment has the return to origin function enabled, and	0~2000	100
	Acceleration time	Register' path function setting2'ofBit2Location1,	(Read and Write)	
		Then the 'acceleration time to return to origin' adopts this register value;		
		unit:ms		
		(1) In multi-stage position/speed mode, set the corresponding		
		deceleration time within the path;	0.3000	
0x0067	path0Run/Return to origin	(2) If the path segment has the return to origin function enabled, and	0~2000	100

## 4.3 MODBUSCommon function codes

# 4.3.1Read Holding Register Command0x03

(1) The command to read a single register is as follows:

### Master->Slave data:

illustrate	Device Address	Function code	Register Address	Read register number	CRCcheck
Message	01	03	00 33	00 01	74 05
explain	The master sends a query to the slave for 'maximum speed (0x0033)' Register instruction				

### Slave->Master data:

illustrate	Device Address	Function code	Returns the number of bytes	Register Value	CRCcheck		
Message	01	03	02	03 E8	74 05		
explain		Slave returns data: Maximum speed1000rev/min					

<sup>(2)</sup> The commands to read multiple registers are as follows:

### Master->Slave data:

illustrate	Device Address	Function code	Register Address	Read register number	CRCcheck		
Message	01	03	00 30	00 04	44 06		
explain	The	The host asks the slave for the starting speed (0x0030)'Start4Register value					

### Slave->Master data:

illustrate	Device Address	Function code	Returns the number of bytes	Register Value	CRCcheck			
	01	02	08	00 05 00 64	F0 7E			
Message	01	03	08	00 64 03 E8	FU /E			
explain Slave returns data: start speed5rev/min, acceleration time100ms, deceleration time100ms, Maximum speed1000rev/min								

Note: The maximum number of queries cannot exceed16registers.

## 4.3.2Write Single Register Command0x06

(1) Write the set value to the register

# Master->Slave data:

illustrate	Device Address	Function code	Register Address	Writing Data	CRCcheck			
Message	01	06	00 30	01 2C	89 88			
explain		Master to slave's starting speed (0x0030)' Register write value300						

## Slave->Master data:

illustrate	Device Address	Function code	Register Address	Writing Data	CRCcheck		
Message	01	06	00 30	01 2C	89 88		
explain		After receiving the command, the slave returns the same command for confirmation					

## 4.3.3Write multiple registers command0x10

### Master->Slave data:

illustrate	Device Address	Function code	Starting address	Write Register	Total bytes	Writing Data	Writing Data	CRCschool  Test	
Message	01	10	00 30	00 02	04	01 2C	03 E8	30 30	
explain	The host wri	The host writes two registers to the slave to set the starting speed (0x0030)' and 'acceleration time (0x0031)'register							

## Slave->Master data:

illustrate	Device Address	Function code	Starting address	Write register	CRCcheck		
Message	01	10	00 30	00 02	41 C7		
explain		After receiving this instruction, the slave returns the number of registers written for confirmation					

#### 4.4Communication error code

 ${\tt 485series MODBUSThe\ communication\ abnormality\ code\ table\ is\ as\ follows:}$ 

## surface4.11 MODBUSException code

Exception code	name	meaning
01	CRCVerification Error	CRCVerification error.
02	Function code sending error	The slave receives0x03,0x06,0x10Function codes other than .
03	Error reading illegal data address	The data address requested to be read does not exist in the slave.
04	Write data address exceeds  Address range	The register address to which data is written exceeds the register address definition range.
05	Read register count overflow	At most once read16data of an address.
06	Function code illegal read and write data error	Function code read and write attributes are divided into three types: read-only, write-only, and read-write.  Abnormal data operation error.
07	The data written into the register exceeds the limit	The data content written to the register exceeds its specified range.

# 4.4.1 CRCVerification Error

As shown in the following table, if the host sends a frame read data command, and an error occurs during the data transmission, the slave device calculates the frame number.

 $According \ to \ the \ obtained CRC The \ check \ value \ is \ not 85\ C1, \ the \ slave \ returns \ an \ exception \ code 01.$ 

### Master->Slave data:

illustrate	Device Address	Function code	Register Address	Read register number	CRCcheck
Message	01	03	00 20	00 01	85 C1

### Slave->Master data:

illustrate	Device Address	Function code+0x80	Exception code	CRCcheck
Message	01	83	01	80 F0

#### 4.4.2Function code sending error

As shown in the following table, if the function code requested by the host is not0x03,0x06 and 0x10, the slave returns an exception code 02.

### Master->Slave data:

illustrate	Device Address	Function code	Register Address	Read register number	CRCcheck
Message	01	02	00 00	00 04	79 C9

### Slave->Master data:

illustrate	Device Address	Function code+0x80	Function code+0x80 Exception code	
Message	01	82	02	61 C1

## 4.4.3Error reading illegal data address

As shown in the following table, if the data address requested by the host is illegal, that is, it does not exist, the slave returns an exception code.03.

## Master->Slave data:

illustrate	Device Address	Function code	Register Address	Read register number	CRCcheck
Message	01	03	00 FF	00 01	B4 3A

## Slave->Master data:

illustrate	Device Address	Function code+0x80	Exception code	CRCcheck
Message	01	83	03	01 31

# 4.4.4The write data address exceeds the address range

As shown in the following table, if the register address to which the host writes data exceeds the defined range, the slave returns an exception code.04.

# Master->Slave data:

illustrate	e	Device Address	Function code	Register Address	Writing Data	CRCcheck
Message	e	01	06	FF 00	0B 00	BE FE

#### Slave->Master data:

illustrate	Device Address	Function code+0x80	Exception code	CRCcheck
Message	01	86	04	43 A3

# 4.4.5Read register count overflow

As shown in the following table, if the number of registers requested by the host exceeds the maximum range of one read, the slave returns an exception code05.

### Master->Slave data:

illustrate	Device Address	Function code	Register Address	Read register number	CRCcheck
Message	01	03	00 20	00 20	45 D8

Read once 32 The data of the address exceeds the set range and returns an exception code 05.

#### Slave->Master data:

illustrate	Device Address	Function code+0x80	Exception code	CRCcheck
Message	01	83	05	81 33

#### 4.4.6Function code illegal read and write data error

As shown in the following table, the function code read and write attributes are divided into three types: read-only, write-only, and read-write. For register operations that do not conform to the function code attributes

The machine returns an exception code06.

## Master->Slave data:

illustrate	Device Address	Function code	Register Address	Read register number	CRCcheck
Message	01	03	00 27	00 01	34 01

 $Assume\ register 0x0027 It\ is\ a\ write-only\ address.\ If\ you\ perform\ a\ read\ operation\ on\ it,\ an\ exception\ code\ will\ be\ reported. 06.$ 

## Slave->Master data:

illustrate	Device Address	Function code+0x80	Exception code	CRCcheck
Message	01	83	06	C1 32

### 4.4.7 The data written into the register exceeds the limit

As shown in the following table, if the data content written to the register exceeds its specified range, the slave returns an exception code07.

# Master->Slave data:

illustrate	Device Address	Function code	Register Address	Writing Data	CRCcheck
Message	01	06	00 30	C3 50	D9 09

#### Slave->Master data:

illustrate	Device Address	Function code+0x80	Exception code	CRCcheck
Message	01	86	07	03 A2

### 4.5Application Examples

#### 4.5.1Position Mode Operation Setting Example

The position mode includes relative position and absolute position. After the corresponding parameters are set by the host computer, the motor runs at a certain angle.

For example, setting the drive1The operating parameters in open-loop mode are: effective current2000mA, Segment1000Pul/rev, starting speed10r/min,

 $Acceleration\ time 100 ms,\ deceleration\ time 100 ms,\ Maximum\ speed 300 r/min,\ forward\ rotation 1 circle\ and\ start\ running\ in\ relative\ position\ mode.$ 

#### Notice:

(1) Before communication, it is necessary to confirm whether the communication baud rate and serial port data format of the master and slave stations are consistent;

(1) Before setting the parameters, you need toSW1-SW4Set tooff off off offoron off off, make sure the drive address is1;

(2) like 485 The drive is closed-loop by default, and the open-loop mode can be set through the register 0x001 Cset up;

(3) The following steps 1-9 There is no particular order for the settings. 10 The previous settings are completed, and then the motor can be started;

(4) In this example, the steps3-8The setting adopts the 'write single register' command, and can also be set by 'write multiple registers command'.

For specific command setting rules, please refer to 4.3.3 subsection;

#### The specific setting steps are as follows:

step	Function settings	Data transmission direction	instruction
1		Master->Slave	01 06 00 1E 07 D0 EA 60
1	Set the effective current to2000mA	Slave->Master	01 06 00 1E 07 D0 EA 60
2		Master->Slave	01 06 00 1F 03 E8 B8 B2
2	Set the subdivisions to 1000 Pul/rev	Slave->Master	01 06 00 1F 03 E8 B8 B2
		Master->Slave	01 06 00 30 00 0A 09 C2
	Set the starting speed to10 r/min	Slave->Master	01 06 00 30 00 0A 09 C2
		Master->Slave	01 06 00 31 00 64 D9 EE
4	Set the acceleration time to100ms	Slave->Master	01 06 00 31 00 64 D9 EE
5		Master->Slave	01 06 00 32 00 64 29 EE
5	Set the deceleration time to100ms	Slave->Master	01 06 00 32 00 64 29 EE
6	Set the maximum speed to 300 r/min	Master->Slave	01 06 00 33 01 2C 79 88
O O		Slave->Master	01 06 00 33 01 2C 79 88
7		Master->Slave	01 06 00 34 03 E8 C8 BA
,	Set the total pulse number low bit to1000	Slave->Master	01 06 00 34 03 E8 C8 BA

0	8 Set the total pulse count high bit to	Master->Slave	01 06 00 35 00 00 99 C4
0		Slave->Master	01 06 00 35 00 00 99 C4
9	Send an enable command to lock the motor	Master->Slave	01 06 00 39 00 01 98 07
9		Slave->Master	01 06 00 39 00 01 98 07
10	10 Speed mode start command	Master->Slave	01 06 00 37 00 01 F9 C4
10		Slave->Master	01 06 00 37 00 01 F9 C4

# 4.5.2Speed Mode Operation Setting Example

In speed mode, after the corresponding parameters are set by the host computer, the motor will maintain the set speed and run at a constant speed.

1 The operating parameters in open-loop mode are: effective current 2000 mA, Segment 1000 Pul/rev, starting speed 10 r/min, acceleration time 100 ms, acceleration time 100

Deceleration time100ms, Maximum speed300r/min, and then maintain a constant speed.

#### Precautions before operation:

(1) Before communication, it is necessary to confirm whether the communication baud rate and serial port data format of the master and slave stations are consistent;

- (2) Before setting the parameters, you need toSW1-SW4Set tooff off off off off off, make sure the drive address is1;
- $(3) like 485 The \ drive is \ closed-loop \ by \ default, \ and \ the \ open-loop \ mode \ can \ be \ set \ through \ the \ register 0x001 Cset \ up;$
- (4) The following steps1-7There is no particular order for the settings.8The previous settings are completed, and then the motor can be started;
- (5) In this example, the steps3-6The setting adopts the 'write single register' command, and can also be set by 'write multiple registers command'.

For specific command setting rules, please refer to 4.3.3 subsection;

## The specific setting steps are as follows:

step	Function settings	Data transmission direction	instruction
	Set the effective current to 2000mA	Master->Slave	01 06 00 1E 07 D0 EA 60
K		Slave->Master	01 06 00 1E 07 D0 EA 60
2		Master->Slave	01 06 00 1F 03 E8 B8 B2
2	Set the subdivisions to1000Pul/rev	Slave->Master	01 06 00 1F 03 E8 B8 B2
3		Master->Slave	01 06 00 30 00 0A 09 C2
3	Set the starting speed to10 r/min	Slave->Master	01 06 00 30 00 0A 09 C2
4		Master->Slave	01 06 00 31 00 64 D9 EE
4	Set the acceleration time to100ms	Slave->Master	01 06 00 31 00 64 D9 EE
5	Set the deceleration time to100ms	Master->Slave	01 06 00 32 00 64 29 EE

		Slave->Master	01 06 00 32 00 64 29 EE
6	Set the maximum speed to	Master->Slave	01 06 00 33 01 2C 79 88
0	300 r/min	Slave->Master	01 06 00 33 01 2C 79 88
7		Master->Slave	01 06 00 39 00 01 98 07
,	Send an enable command to lock the motor	Slave->Master	01 06 00 39 00 01 98 07
8		Master->Slave	01 06 00 37 00 01 F9 C4
0	Speed mode start command	Slave->Master	01 06 00 37 00 01 F9 C4

### 5. Introduction to Motion Control Function

### 5.1Position Mode

Position mode includes relative position and absolute position. Relative position takes the current static point as the starting point, and absolute position takes the current static point as the starting point.

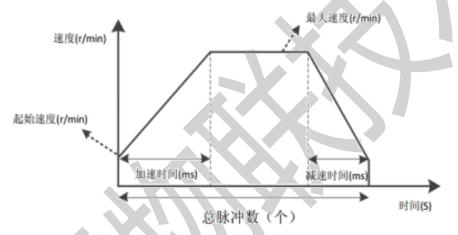

The position after reset or homing is the starting point. The 'start command' register can be used to control whether it is relative position movement or absolute position movement.

For reference4.2.5and5.5chapter.

In position mode, after the corresponding parameters are set by the host computer, the motor runs at a certain angle. The running process adopts trapezoidal acceleration and deceleration.

Now, users can set the starting speed, maximum speed, acceleration time, deceleration time, and total pulse number through the host computer to achieve accurate

Position control. The trapezoidal acceleration and deceleration curve is shown in the figure 5.1 shown.

picture5.1Trajectory of normal operation of position mode

Please note that in relative position mode, the direction of the motor is determined by setting the positive or negative of the total pulse number. The total pulse number is usually defined as positive.

When the value is set, the motor rotates forward, otherwise, the motor rotates reversely. In absolute position mode, the initial direction of the motor is positive or negative with the set total pulse number

After the pulse is turned off, the subsequent running direction will also be related to the total number of pulses set.

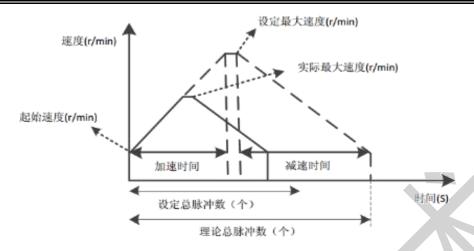

When the total number of pulses set by the user is small, the motor may need to decelerate before accelerating to the maximum speed.6

As shown in the figure, the solid line shows the actual running track of the motor, and the dotted line shows the track required to accelerate to the set maximum speed.

The number of pulses is the theoretical minimum total number of pulses calculated according to the user-set parameters: starting speed, maximum speed, acceleration time, and deceleration time.

When the total pulse number set by the user is less than the theoretical minimum total pulse number, the motor will5.2Running along the solid line.

picture5.2Position mode sets the running trajectory with a smaller total pulse number

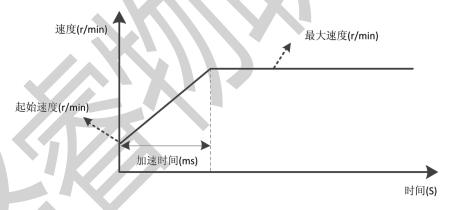

# 5.2Speed Mode

Speed mode means that the motor keeps running at a constant speed at the set speed. Different from position mode, the user only needs to set the starting speed, the maximum speed and the

The motor accelerates to the maximum speed according to the set parameters and keeps running at a constant speed.

The direction of the motor is determined by setting the maximum speed to a positive or negative value. Usually, when the maximum speed is positive, the motor rotates forward, and vice versa.

Reverse. The acceleration curve of speed mode is shown in the figure 5.3 shown.

picture5.3Speed mode acceleration curve

### 5.3Return to origin mode

IRS57EAll-in-one485The bus-type stepper driver currently supports the following return to zero methods:3)-(-6),17-30,33-35,37-39, these Mode requires the use of limits, origin orZSignal.

Before configuring the homing mode, you need to configure the input port function to origin, positive limit or negative limit.17-18for2kind

Limit return to zero mode, mode19-22for4Ways to return to zero:23-26for4Origin + positive limit return to zero mode, mode27-30for

4The origin + negative limit return to zero method,33-34for2kindZSignal return to zero mode,35,37To use the current as zero point,38-39Return to zero position

model,(-3)-(-4)It is the stall return to zero mode in closed loop mode.

The start of the homing mode can be triggered by sending a 'start command' from the host computer, or by using an externalIOThe signal is used as a trigger source to start returning to the origin function, but the function of a certain input port needs to be configured as the "home enable signal" function. Before this, you can use the register

0x003B~0x0041Configure the homing mode, homing speed, homing acceleration/deceleration time, and homing compensation value.

Apply and select the appropriate homing mode. The following sections briefly introduce the path processes of several homing modes.

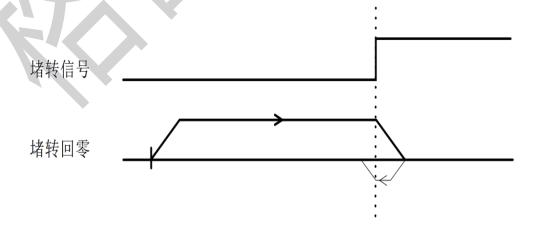

Note: In the following schematic diagrams defining all return-to-zero methods, movement to the right is positive movement, and movement to the left is negative movement.

## 5.3.1Way(-3)(Stalled return to zero1)

The motor initially returns to the origin speed/1/Running in the forward direction, after a stall occurs, the motor decelerates to stop and moves in the reverse direction. After the motor dynamic torque disappears

Decelerate to a stop and use this position as the origin.

The entire action of this zero return method is shown in the figure below. No detailed description is given here.

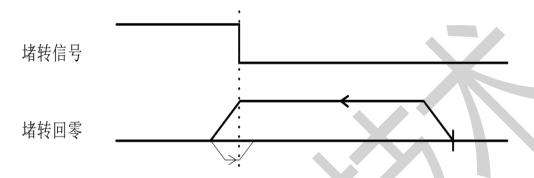

# 5.3.2Way(-4)(Stalled return to zero2)

The motor initially returns to the origin speedV1'Running in the opposite direction, after a stall occurs, it decelerates to stop and moves in the opposite direction. After the dynamic torque of the motor disappears,

Decelerate to a stop and use this position as the origin.

The entire action of this zero return method is shown in the figure below. No detailed description is given here.

### 5.3.3Way(-5)(Stalled return to zero3)

The motor initially returns to the origin speedV1When running in the positive direction and a stall occurs, the machine stops immediately and takes this position as the origin.

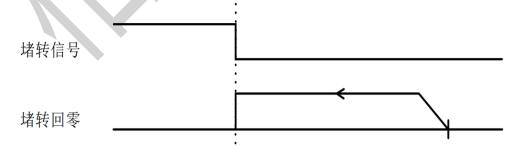

The entire action of this zero return method is shown in the figure below. No detailed description is given here.

# 5.3.4Way(-6)(Stalled return to zero4)

The motor initially returns to the origin speedV1'If the machine runs in the reverse direction and a stall occurs, it stops immediately and takes that position as the origin.

 $The \ entire \ action \ of \ this \ zero \ return \ method \ is \ shown \ in \ the \ figure \ below. \ No \ detailed \ description \ is \ given \ here.$ 

### 5.3.5Way17(Negative limit return to zero)

The origin stop position of 'Negative limit return to zero' is at the negative limit signal.

The whole action of 'negative limit return to zero' is divided into two cases, as follows:

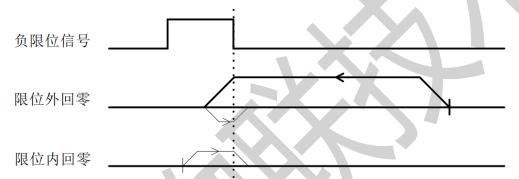

ConditionA: After the drive receives the 'home enable signal' command, it will start at the 'home speedV1', 'Return to origin acceleration and deceleration time' several parameters open

Starts to move, and when encounters the rising edge of the limit signal, it decelerates and stops. Then it returns to the origin speedV2'Run in the opposite direction until the limit signal is met.

At the falling edge, deceleration stops and the entire return to zero action is completed.

ConditionB: After receiving the 'Home Enable Signal' command, the drive is within the limit and willV2', 'Return to the original

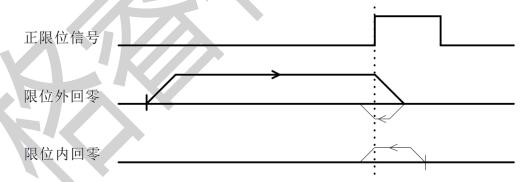

Click the 'acceleration/deceleration time' parameter to start the movement. When the falling edge of the limit signal is encountered, the movement will be decelerated and stopped, and the whole return to zero action is completed

## 5.3.6Way18(Positive limit return to zero)

The origin stop position of 'Positive limit return to zero' is at the positive limit signal.

Positive limit return to zero' is similar to 'Negative limit return to zero', except that the running direction is opposite, so it will not be explained in detail here.

# 5.3.7Way19(Return to zero1)

'Return to zero1'The origin stop position is on the left side of the rising edge of the origin signal in the positive direction.

'Return to zero1'The whole action is divided into two cases, as follows:

Condition A: After the drive receives the 'home enable signal' command, it will start at the 'home speedV1', 'Return to origin acceleration and deceleration time' and other parameters

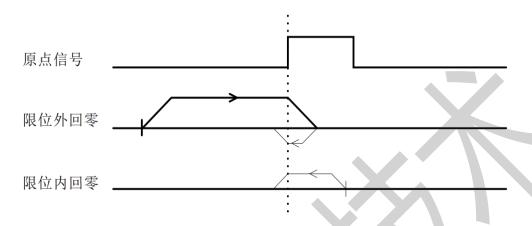

Move in the positive direction, and when it encounters the rising edge of the origin signal, it decelerates and stops. Then it returns to the origin speedV2Run in the opposite direction until it encounters the origin signal

When the signal falls, the deceleration stops and the whole return to zero action is completed

 $Condition B: After \ receiving \ the \ 'home \ enable \ signal' \ command, \ the \ drive \ is \ in \ the \ home \ signal, \ and \ will V2', 'Back' \ and \ will V2', 'Bac$ 

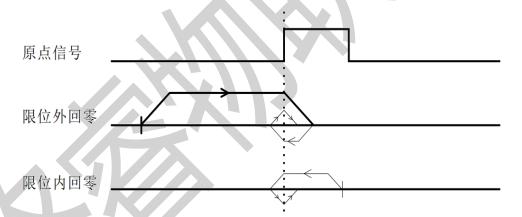

The origin acceleration/deceleration time and several parameters move in the opposite direction. When the origin signal falls, the deceleration stops and the whole return to zero action is completed.

# 5.3.8Way20(Return to zero2)

 ${\tt 'Return\,to\,zero2'} The\,origin\,stop\,position\,is\,on\,the\,right\,side\,of\,the\,rising\,edge\,of\,the\,origin\,signal\,in\,the\,positive\,direction.$ 

'Return to zero2'The whole action is shown in the figure below. No detailed description is given here.

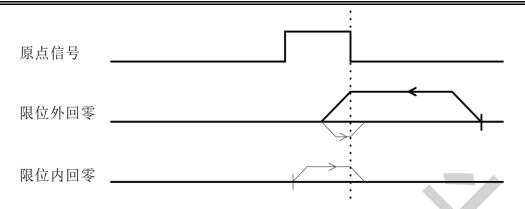

# 5.3.9Waytwenty one(Return to zero3)

Return to zero3'The origin stop position is on the right side of the rising edge of the origin signal in the reverse direction.

'Return to zero3'The whole action is similar to 'return to zero1'The difference is that the initial running direction is opposite. No detailed description will be given here.

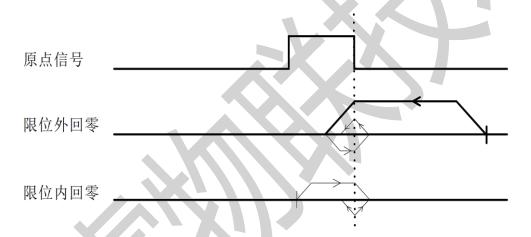

### 5.3.10Waytwenty two(Return to zero4)

'Return to zero4'The origin stop position is on the left side of the rising edge of the origin signal in the reverse direction.

'Return to zero4'The whole action is similar to 'return to zero2'The difference is that the initial running direction is opposite. No detailed description will be given here

### 5.3.11Waytwenty three(Origin + positive limit return to zero1)

'Origin + positive limit return to zero1'The origin stop position is on the left side of the rising edge of the origin signal in the positive direction.

'Origin + positive limit return to zero1'The whole action is divided into three cases, as follows:

Condition A: After the drive receives the 'home enable signal' command, it will start at the 'home speedV1', 'Return to origin acceleration and deceleration time' and other parameters

Move in the positive direction, and when it encounters the rising edge of the origin signal, it decelerates and stops. Then it returns to the origin speedV2'Run in the opposite direction until it encounters the origin signal

When the signal falls, the deceleration stops and the whole return to zero action is completed.

ConditionB: After the drive receives the 'home enable signal' command, it will start at the 'home speedV1', 'Return to origin acceleration and deceleration time' and other parameters

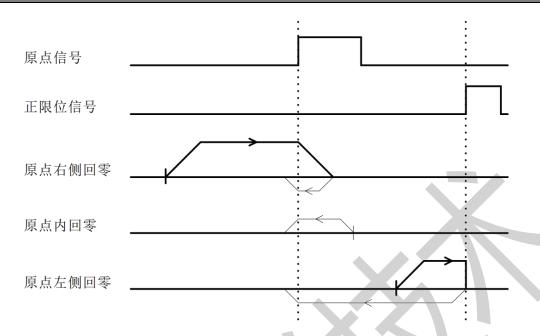

Move in the positive direction, and stop immediately when encountering the rising edge of the positive limit signal. Then return to the origin at the speedV2Run in the opposite direction until you reach the origin

When the signal falls, the deceleration stops and the entire return to zero action is completed.  $\label{eq:complete}$ 

 $Condition C: After \ receiving \ the \ 'home \ enable \ signal' \ command, \ the \ drive \ is \ in \ the \ home \ signal, \ and \ will V2', 'Back' \ and \ will V2', 'Bac$ 

The origin acceleration/deceleration time and several parameters move in the opposite direction. When the origin signal falls, the deceleration stops and the whole return to zero action is completed.

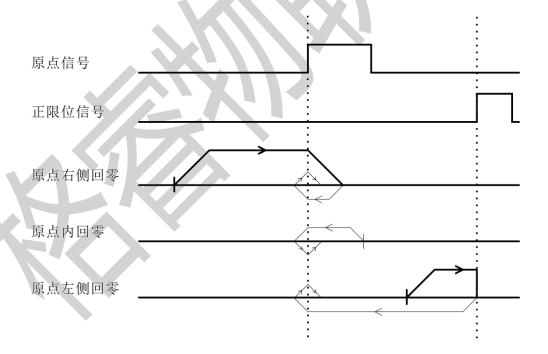

### 5.3.12Waytwenty four(Origin + positive limit return to zero2)

'Origin + positive limit return to zero2'The origin stop position is on the right side of the rising edge of the origin signal in the positive direction.

'Origin + positive limit return to zero2'The whole action is shown in the figure below. No detailed description is given here.

## 5.3.13Way25(Origin + positive limit return to zero3)

'Origin + positive limit return to zero3'The origin stop position is on the left side of the falling edge of the origin signal in the positive direction.

'Origin + positive limit return to zero1'The whole action is divided into three cases, as follows:

ConditionA: After the drive receives the 'home enable signal' command, it will start at the 'home speedV1', 'Return to origin acceleration and deceleration time' and other parameters

Move in the positive direction. When the origin signal rises, the machine continues to run. When the origin signal falls, the machine slows down and stops. Then the machine returns to the original position.

Origin speedV2Tt runs in the opposite direction until it encounters the rising edge of the origin signal, then decelerates and stops, and the entire return to zero action is completed.

ConditionB: After the drive receives the 'home enable signal' command, it will start at the 'home speedV1', 'Return to origin acceleration and deceleration time' and other parameters

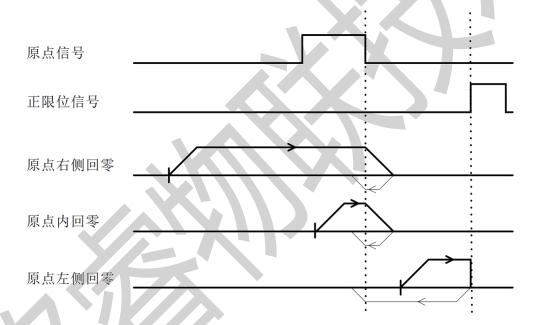

Move in the positive direction, and stop immediately when encountering the rising edge of the positive limit signal. Then return to the origin at the speedV2'Run in the opposite direction until you reach the origin

When the signal rises, the deceleration stops and the entire return to zero action is completed.

ConditionC: After receiving the 'home enable signal' command, the drive is in the home signal, and willV1','Back

The origin acceleration and deceleration time's several parameters move in the positive direction, and when the origin signal falls, it decelerates and stops. Then it returns to the origin speedV2

It runs in the opposite direction until it encounters the rising edge of the origin signal, then decelerates and stops, and the entire return to zero action is completed

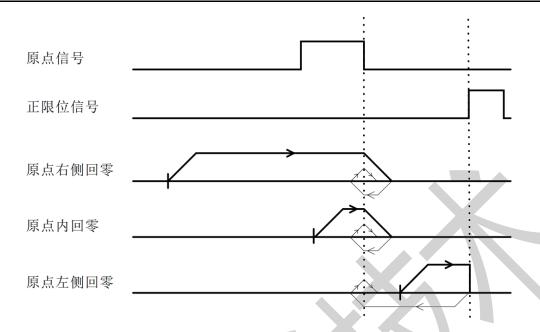

## 5.3.14Way26(Origin + positive limit return to zero4)

'Origin + positive limit return to zero4'The origin stop position is on the right side of the falling edge of the origin signal in the positive direction.

'Origin + positive limit return to zero4'The whole action is shown in the figure below. No detailed description is given here.

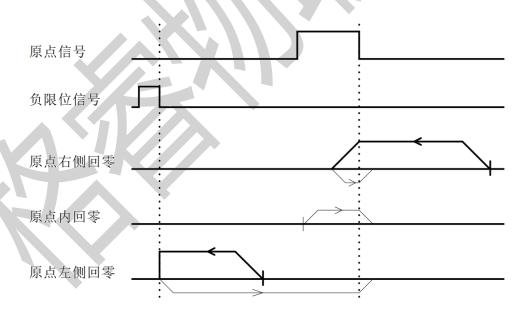

#### 5.3.15Way27(Origin + negative limit return to zero1)

 $\label{prop:continuous} \mbox{'Origin + negative limit return to zero 1 The origin stop position is on the right side of the rising edge of the origin signal in the reverse direction.}$ 

'Origin + negative limit return to zero1'The whole action is the same as 'origin + positive limit return to zero1'The difference is that the initial running direction is opposite.

Please explain in more detail.

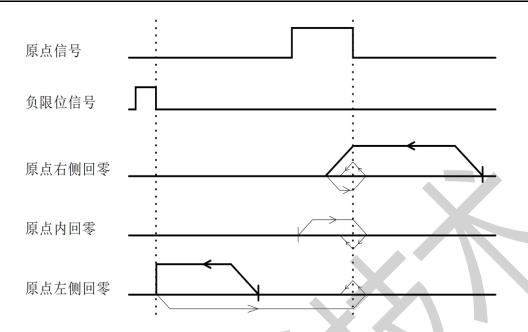

## 5.3.16Way28(Origin + negative limit return to zero2)

 $\label{thm:continuous} Origin + negative limit return to zero 2 The origin stop position is on the left side of the rising edge of the origin signal in the reverse direction.$ 

'Origin + negative limit return to zero2'The whole action is the same as 'origin + positive limit return to zero2'The difference is that the initial running direction is opposite.

Please explain in more detail.

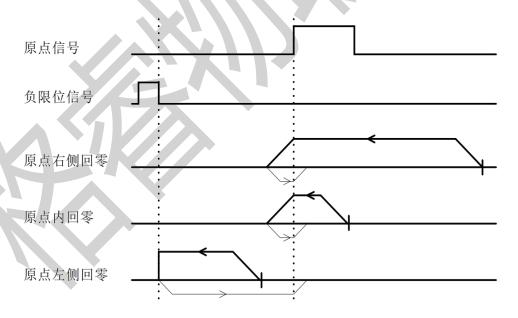

#### 5.3.17Way29(Origin + negative limit return to zero3)

Origin + negative limit return to zero3The origin stop position is on the right side of the falling edge of the origin signal in the reverse direction.

'Origin + negative limit return to zero3'The whole action is the same as 'origin + positive limit return to zero3'The difference is that the initial running direction is opposite.

Please explain in more detail.

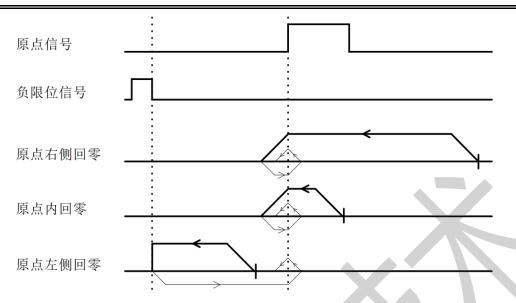

# 5.3.18Way30(Origin + negative limit return to zero4)

'Origin + negative limit return to zero4'The origin stop position is on the left side of the falling edge of the origin signal in the reverse direction.

Origin + negative limit return to zero4'The whole action is the same as 'origin + positive limit return to zero4'The difference is that the initial running direction is opposite.

Please explain in more detail.

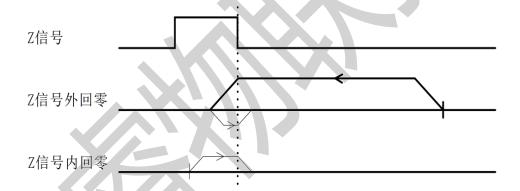

# 5.3.19Way33(ZSignal return to zero1)

This zero return method is IThe signal is used as the zero return detection signal, which is consistent with the direction of 'negative limit zero return'. The origin stop position is Is I grant light.

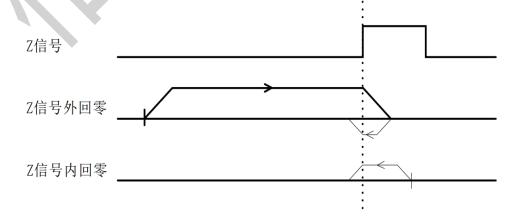

'ZSignal return to zero1'The whole action is shown in the figure below. No detailed description is given here.

# 5.3.20Way34(ZSignal return to zero2)

This zero return method isZThe signal is used as the zero return detection signal, which is consistent with the direction of 'positive limit return to zero'. The origin stop position isZLeft side of signal.

'ZSignal return to zero2'The whole action is shown in the figure below. No detailed description is given here.

# 5.3.21Way35,37(The current position is the origin)

This zero return method uses the current point as the origin.

# 5.3.22Way38(Position return mode1)

This zero return method is consistent with the negative limit zero return direction. When the operation reaches the set position, it stops immediately and takes this position as the origin.

The position value is set by register0x0044,0x0045set up;

# 5.3.23Way39(Position return mode2)

This zero return method is consistent with the positive limit zero return direction. When the operation reaches the set position, it stops immediately and takes this position as the origin.

The position value is set by register0x0044,0x0045set up;

### 5.4Multi-segment mode

 $The \ multi-stage \ mode \ includes \ multi-stage \ position \ mode \ and \ multi-stage \ speed \ mode. \ The \ register \ range \ involved \ is:0x0060~0x015F.$ 

### 5.4.1Multi-position mode

 $The \textit{ multi-segment position mode combines multiple position segments.} \quad According \textit{ to its path ION umber (PTIN0 \sim PTIN3)} \textit{And external IOT rigger signal (TRIG, to its path ION umber (PTIN0 \sim PTIN3))} \\$ 

You can also set the working mode to start the motor without this trigger signal to complete a series of position actions.

The multi-segment position mode function setting mainly uses two registers (path0As an example), as shown in the following table:

Register Name	Included Features
	(1) Position/velocity mode;
	(2)Relative/absolute position selection;
path0Function settings1	(3) IOIn-position output signal is prohibited;
	(4) Whether to jump;
	(5) Jump path number;
	(1) Whether returning to the origin is enabled;
and Of water and and	(2) Whether to execute the path after returning to the origin;
path0Function settings2	(3) Selection of parameters such as the speed of returning to the origin;
	(4) Return to origin method;

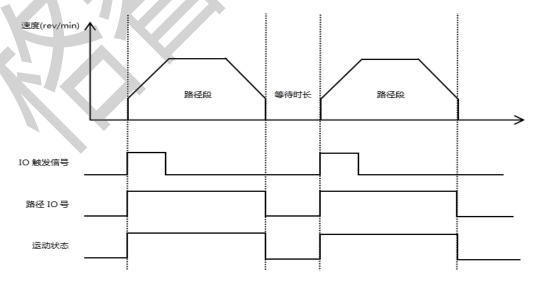

By configuring the function registers of the corresponding paths, various position mode controls can be realized, such as IOT rigger + Path IOmodel, IOT rigger Order

Sub-cycle mode, IOT rigger continuous cycle mode, etc. Users can configure accordingly according to different needs. The following is a brief introduction to the three common modes.

# 5.4.1.1 IOTrigger + PathIOmodel

IOTrigger + PathIOMode means that the execution of each location segment requires a pathIONumber(PTIN0-PTIN3)And externalIOTrigger signal

(TRIG)Start the motor and run. The execution diagram is shown below.

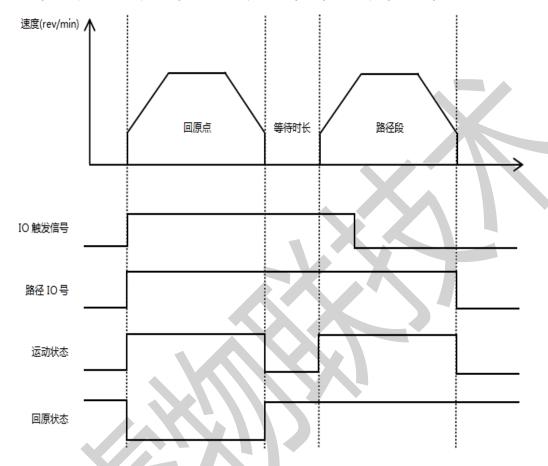

picture5.4 IOTrigger + PathIOMode operation diagram

Note: This mode does not enable the path jump function, and the next path can only be given after the waiting time is over.IOTrigger signal!

If you need to return to the origin before executing a certain path, you need to configure the register' path function setting2'function, turn on the return to origin enable bit, select return

The execution diagram includes parameters such as the speed of the origin, whether to execute the path after returning to the origin, and the corresponding return to the origin method, etc.

picture5.5Back to origin+IOTrigger + PathIOMode operation diagram

 $path IOThe\ combination\ is\ currently\ available\ up\ to 3 indivual IOBy\ setting IOIs\ the\ trigger\ function\ valid\ and\ can\ support\ startup 4 Segment\ or 7 Rank$ 

The combinational logic is shown in the following table.

IOPort/Run	PTIN0	PTIN1	PINT2	pathIO	IOTrigger function	IOTrigger function
Path Segment				Combination Value	(TRIG)efficient	(TRIG)invalid
Path Segment0	0	0	0	0	1(Bootable)	- (invalid)
Path Segment1	1	0	0	1	1(Bootable)	- (bootable)
Path Segment2	0	1	0	2	1(Bootable)	- (bootable)
Path Segment3	1	1	0	3	1(Bootable)	- (bootable)
Path Segment4	0	0	1	4	- (invalid)	- (bootable)
Path Segment5	1	0	1	5	- (invalid)	- (bootable)
Path Segment6	0	1	1	6	- (invalid)	- (bootable)
Path Segment7	1	1	1	7	- (invalid)	- (bootable)

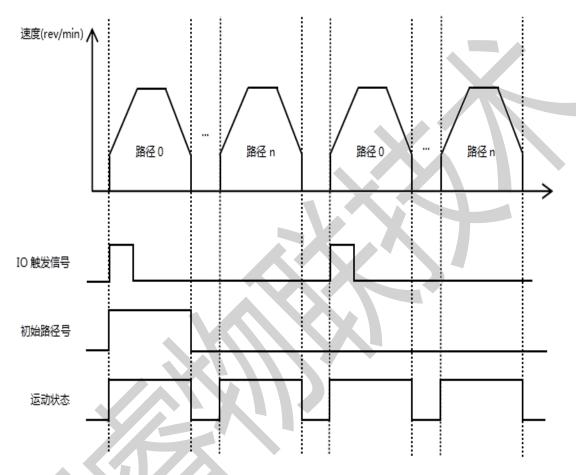

#### 5.4.1.2 IOTriggering single-shot mode

IOTriggering the single loop mode means that each path starts the jump function (IOAfter the trigger function is valid, each time the externalIOTrigger signal(TRIG)

After the motor is started, it executes a full cycle. If you want to execute a second cycle, you need an external IOT rigger signal (TRIG) Re-trigger and the cycle is started, it executes a full cycle. If you want to execute a second cycle, you need an external IOT rigger signal (TRIG) Re-trigger in the cycle is started, it executes a full cycle. If you want to execute a second cycle, you need an external IOT rigger signal (TRIG) Re-trigger in the cycle is started, it executes a full cycle. If you want to execute a second cycle, you need an external IOT rigger signal (TRIG) Re-trigger in the cycle is started in the cycle is started in the cycle is started in the cycle in the cycle is started in the cycle in the cycle is started in the cycle in the cycle in the cycle is started in the cycle in the c

The execution diagram is shown below.

picture 5.6 IODiagram of triggering single cycle mode operation

Note: This mode requires the path jump function to be turned on, but the path jump function must be turned off for the last path segment!

If you need to return to the origin before executing a certain path, you need to configure the register path function setting2 function, turn on the return to origin enable bit, select return

The speed of the origin, whether to execute the path after returning to the origin, and the corresponding return to the origin method, etc. The execution trajectory of each path is shown in the figure.5.7

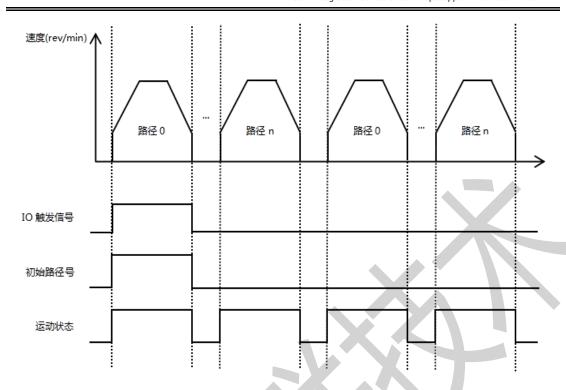

Similar, no further explanation here.

### 5.4.1.3 IOTriggering continuous loop mode

IOTriggering the continuous loop mode means that each path starts the jump function (IOAfter the trigger function is valid, when the externallOTrigger signal(TRIG)start

After the motor is running, the preset position segment can be executed cyclically. The execution diagram is shown below.

picture 5.7 IODiagram of triggering continuous loop mode operation

Note: This mode requires the path jump function to be enabled, and the last path segmentnThe jump path must be set to the initial path!

If you need to return to the origin before executing a certain path, you need to configure the register' path function setting2' function, turn on the return to origin enable bit, select return

The speed of the origin, whether to execute the path after returning to the origin, and the corresponding return to the origin method, etc. The execution trajectory of each path is shown in the figure 5.7

Similar, no further explanation here.

# 5.4.2Multi-speed mode

 $The \ multi-speed \ mode \ combines \ multiple \ speed \ sections. \qquad According \ to \ its \ path ION umber (PTIN0 \sim PTIN3) And \ external IOT rigger \ signal (TRIG)$ 

Start the motor to run and complete a series of speed operations.

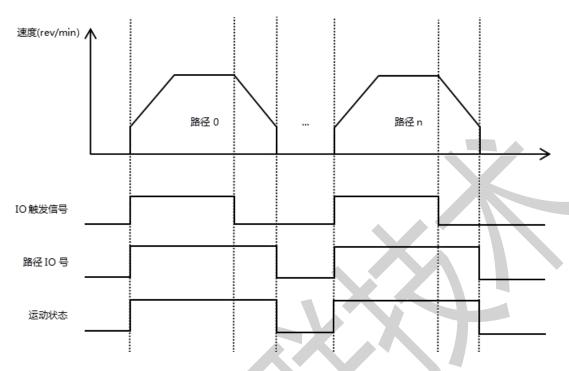

The multi-speed mode function setting mainly uses two registers (with path0As an example), as shown in the following table:

Register Name	Included Features
	(1) Position/velocity mode;
	(2)Relative/absolute position selection;
path0Function settings1	(3) IOIn-position output signal is prohibited;
	(4) Whether to jump;
	(5) Jump path number;
	(1) Whether returning to the origin is enabled;
path0Function settings2	(2) Whether to execute the path after returning to the origin;
pautor uncuon settings2	(3) Selection of parameters such as the speed of returning to the origin;
	(4) Return to origin method;

By configuring the function register of the corresponding path, the corresponding path can be configured to run in speed mode. Before executing speed mode operation,

First, execute the return to origin and other actions, but please note that the jump function is not supported in the multi-speed mode. The execution diagram is shown below.

picture5.8 IOTrigger + PathIOMode operation diagram

If you need to return to the origin first when executing a path at a certain speed, you need to configure the register' path function setting2 function, turn on the return to origin enable bit,

Select the parameters such as the speed of returning to the origin, whether to execute the path after returning to the origin, and the corresponding return to the origin method, etc. The execution trajectory of each path

Follow the picture5.7similar.

# 5.5Motion control instructions

# 5.5.1Startup Command

The start command address is 0x0037Its functions include speed mode trigger, relative position mode trigger, absolute position mode trigger, and return to origin.

Mode trigger, eachBitThe bit function definitions are shown in the following table:

register	Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8
	reserve	reserve	reserve	reserve	reserve	reserve	reserve	reserve
0x0037	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Startup Command	JOG-	JOG+	Multi-speed	Multi-segment position	Back to origin	Absolute Position	Relative Position	Speed Mode
	sports	sports	trigger	trigger	trigger	trigger	trigger	trigger

The following is an example of the settings:

Speed Mode Movement:01 06 00 37 00 01 F9 C4

Relative position movement:01 06 00 37 00 02 B9 C5

Absolute position movement:01 06 00 37 00 04 39 C7

## 5.5.2Stop Command

The stop command address is 0x0038 Its functions include normal stop, emergency stop, running at the set speed or running along the planned trajectory until a stop of the p

When the motor is running in position mode or speed mode, if it receives a normal stop command, the motor will decelerate and stop according to the set deceleration time.

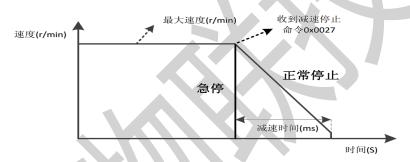

If the stop command is sent, the system will stop the system directly. The setting value range is 0-2, the function definitions of each setting value are shown in the following table:

register	illustrate	
0x0038	0: Normal stop;	
	1: Emergency stop;

# 6. Indicator Light

## 6.1Alarm fault code

 $IRS57EAll-in-one 485 The\ bus-type\ closed-loop\ stepper\ driver\ has\ a\ variety\ of\ alarm\ information.\ When\ the\ driver\ alarms,\ the\ fault\ code\ and\ treatment\ measures\ are$ 

 $As\ table 6.1 For\ details,\ please\ refer\ to\ the\ chapter 4.2.13 Related\ contents\ of\ fault\ code\ parameter\ group.$ 

surface6.1Fault codes and solutions

Fault Codes	Fault subcode	Fault Information	Indicator Lights	Treatment measures
0x01	0x10; <b>(reserve)</b>	Overcurrent	Flash	(1)Check whether the motor wire is connected incorrectly; (2)Check whether there is contact between two adjacent wires; (3)After troubleshooting, power on again for testing;
0x02	0x20: Overpressure alarm; 0x21: Undervoltage alarm;	Overvoltage and under	<sub>voltage</sub> Flash	Check the power supply
0x03	0x30: Positive hard limit overtravel; 0x31: Reverse hard limit overtravel; 0x32: Forward soft limit overtravel; 0x33: Reverse soft limit overtravel;	Hard limit/soft Limit overtravel	none	Move in the opposite direction;
0x04	0x41: Read error; 0x42: Write error;	EEPROM  Read and write errors	none	Resettable
0x05	0x51:CRCVerification error; 0x52: Function code error; 0x53: Error in reading illegal data address; 0x54: The write data address is out of range; 0x55: Read register number overflow (maximum one Reads16registers); 0x56: Illegal reading and writing of function code; 0x57: The data written into the register exceeds the limit;	MODBUS  Communication Error	none	Resettable
0x06	0x60:A,BAll lack phase alarm; 0x61:Aphase lacks phase; 0x62:Bphase lacks phase;	Phase loss alarm	Flash	(1)Check whether the motor wiring is loose or connected incorrectly; (2)After troubleshooting, power on again for testing;
0x07	0x70: Normal out-of-tolerance alarm; 0x71: Overvoltage causes out-of-tolerance alarm; 0x72: Undervoltage causes out-of-tolerance alarm;	Out of tolerance alarm	Flash	(1)Check whether the motor wiring is correct; (2)Check whether the current setting is sufficient; (3)Check whether the power supply is sufficient; (4)The alarm can be cleared by enabling the signal;
0x08	0x80: Timeout alarm when returning to origin;	Back to origin Timeout alarm	Flash	(1)Check whether the limiter is damaged; (2)Check whether the limit wiring is loose; (3)Can be controlled by host computer or externalIOInput power This alarm can be cleared;

				s sus closed 200p stepper Stiver oser mandar
0x09	0x90: Restore factory settings;  0x91: Save the status parameter group;  0x92: Save the common parameter group;  0x93: Save the common open-loop parameter group;  0x94: Save the common closed-loop parameter group;  0x95: Save the basic control parameter group;  0x96: Save the back-to-origin parameter group;  0x97: Save the input and output parameter group;  0x98: Save multi-segment mode parameter group;  0x99: Save the performance parameter group;  0x99: Save the brake parameter group;  0x9B: Save fault code parameter group;  0x9C: Save user parameter group;  0x9D~0x9E:reserve;  0x9F: Save all parameter groups;	Factory Reset/ Save Parameters	Flash	(1) Wait for the indicator light to stop flashing and return to normal  The status will be displayed before the next operation can be performed;
0x0A	0xA0:Vmax>Vmin;	Speed Parameters  Inappropriate settings  Alarm	none	Check if the maximum speed value is less than the minimum speed value;

# **6.2Flashing lights**

 $IRS57EAll-in-one 485 The \ bus \ type \ closed \ loop \ stepper \ driver \ has \ a \ greenled Lights, \ one \ of \ which \ can \ be \ used \ as \ a \ power \ indicator,$ 

The second one can be used as a fault indicator, a dial status switch indicator, and a save or restore parameter indicator. The specific relationship is as follows: 6.2As shown:

When the drive is powered on, theledWhen the drive is powered off,ledOff.

When the DIP switch is turned, the greenledWill flash quickly2This is a normal phenomenon, indicating that the DIP switch status is effective.

When the drive fails, the red and green lights flash alternately, and different flashing patterns indicate different fault information.

When eliminated, greenledKeep on, redledOff.

When saving/restoring parameters, the red and green lights flash alternately. When saving/restoring parameters is completed, the green lightledSteady on, redledOff.

surface6.2 LEDStatus Indicator

ledNumber	of flashes	Phenomenon	illustrate
greenled	redled	After the green light flashes, the red light flashes	
0	-	Green light is always on, red light is off	Driver Enable
1	-	Green light flashes, red light off	The driver is enabled and receives a pulse or start command
1	1	00	Normal out-of-tolerance alarm
2	1		The drive is not enabled and receives a pulse or start command
3	1	0000	(Overvoltage) out-of-tolerance alarm
4	1	0000	(Undervoltage) out-of-tolerance alarm
1	4		Overpressure alarm
2	4		Undervoltage alarm
1	5		Overcurrent alarm (reserved)
1	6		ABPhase loss alarm
2	6		onlyAPhase loss alarm
3	6		onlyBPhase loss alarm
1	8		Timeout alarm in homing mode
1	2		Restoring parameters
2	2		Saving parameters in progress

### VII. Warranty and After-sales Service

## 7.1Warranty

#### 7.1.1Free warranty situation

Our company solemnly promises that if any of our products are damaged during use due to the product itself, we will provide

One year free maintenance service. The shipping cost of the product shall be borne by both parties.

# 7.1.2Warranty void

(1) The driver is damaged due to the customer's own wiring error;		
(2) Exceeding the rated working voltage causes damage to the driver;		
(3) The DC power supply driver is connected to the AC power supply, causing the driver to be damaged;	N. J.	
(4) Due to the extremely bad environment on the customer's site, such as humidity, extreme cold, extreme heat an	nd other adverse environmental factors, the company was not	informed in advance, resulting ir

## The drive is damaged;

- (5) The customer dismantles the drive housing without permission or the serial label number is torn off;
- (6) After the customer confirms receipt15Days later, the casing was obviously damaged or hit, causing damage to the drive;
- (7) Force majeure natural disasters, such as fire, earthquake, tsunami, typhoon, etc.;

In the above cases, our company will charge a certain amount of repair cost after evaluating the interests of all parties. In other cases, repairs will be provided free of charge forever.

## 7.2Exchange

## 7.2.1Product defect replacement

For faults in new products, our company provides three months of free replacement service.

After our technical support staff confirms that the problem is with the product itself, they will send the product back to our company to avoid wasting time and postage on the round-trip.

The customer needs to send the defective product back by express or logistics first. After receiving it, our company will send another new product back to the customer as soon as possible.

Notice: All our products are strictly tested and aged before leaving the warehouse, so it is extremely rare for new products to fail.

Please be sure to read the instructions carefully or consult our technical support staff when operating, or our technical support staff will assist customers in operating remotely.

#### Please note the following points when exchanging goods

 $(1) \ Please\ ensure\ that\ the\ packaging\ is\ complete\ when\ sending\ back\ to\ avoid\ damage\ during\ transportation;$ 

(2) Please ensure that the attached accessories are complete when exchanging goods,

 $\textbf{(3)} \ Each \ driver \ should \ be \ packed \ in \ its \ original \ box \ to \ avoid \ secondary \ damage \ to \ the \ product \ during \ transportation;$ 

(4) If the driver is returned and it is confirmed that the fault is not due to product failure, but due to the customer's negligence in operation, then

The company does not bear the freight (the customer's own negligence includes: connecting the wrong line and causing the driver to be damaged, poor wiring and mistaking the driver for damage,

Operation errors causing the drive to fail to function properly, etc.).

7.2.2Exchange for non-product failure

If the customer is not satisfied with the appearance or function of the product received and wants to replace it with a better driver, he or she can contact us within one week after receiving the product.

The company applies for a replacement service. After verification, the company will return the product. The company will confirm that the returned product has no damage, complete accessories, and

If the product is in good condition, we will replace it with another product. If there is a price difference between the replaced products, the customer shall make up the difference.

Note: The replaced product will no longer be eligible for the non-product failure replacement service. The round-trip shipping and other fees incurred by the non-product failure replacement service

All costs are borne by the customer!

7.3return the goods

Our company provides7Days return service, if you receive this product7Days (subject to the actual receipt date of the customer)

If there are any quality problems with the product itself, please communicate with our salesperson or technical support personnel in time.

After the quality problem of the product itself is found, the customer will send the original complete product and its inner and outer packaging, accessories and shipping order back to our company by express or logistics.

If the customer still insists on returning the goods after our company has checked and confirmed that they are correct, the round-trip shipping costs and all other costs incurred will be borne by the customer.

At your own risk.

Please note the following points when returning goods:

 $\hbox{(1) Please contact the relevant department of our company before making a refund;} \\$ 

(2) The product must be in new condition and complete packaging. Please send it back to our company by express or logistics;

(3) Problems caused by customers such as damaged product appearance, incomplete accessories, etc. will not be accepted;

7.4After-sales service

If you need after-sales service support when using this product, please contact our company as soon as possible.

National free service hotline:0755-23206995;

Technical specialist service hotline:18576758897;

Service time: Monday to Friday8:30-17:30(Except national holidays).
